: Yes true, I did see a so called "amiga" emulator floating around for the pc,
: but of course it never did work. And i can't se how it would for that
: matter.

Well the point is rather moot here as the PC is the largest market on the
planet so it is real and doesnt have to be emulated, there is a MAC, Apple and
C64 Emulator for the PC as well. Both also emulate the Atari ST and Atari
8-bit so all points are basically moot, except the last one. The Amiga
Emulator for kickstart is a joke, no doubt about that one.

Amiga has its problems just like the PC or Mac, but it really doesnt matter
since it is what you want/need that counts...

No, the prices I gave very accurately represent the market in this area.
Possibly other areas are more expensive for Macs and cheaper for PCs.

> Compuq is very expensive and even THAY have mac beat....

Again, no. I was comparing actual street price (one of the best prices in
the area, in fact) on both the Mac and the Compaq. Specific models were
Performa 476 and Compaq Pressario 633. The 633 doesn't have the Mac beat,
though they run at the same speed. Someone else said the sound
card was 16-bit with speaker, microphone, and SCSI ports. This is mostly
true, only it was a $99 Sound Blaster Pro, which is 8-bit, and that gives
the Compaq the exactly same capabilities as the Mac.

>: 3) Most people I've talked to who use both Macs and DOS/Windows on a

>with....

Wrong again. We sell 4 Mac models and a dozen PC models from Leading Edge,
Packard Bell, Compaq, and IBM. The people who have worked on both
invariably enjoy working on the Macs more (bussiness, education, and home
users).

> Anyway I repeat... Windows sux... What is Windows to a PC?
>Try using a Mac with out a mouse.... Windows down grades the system
>Dos is better WITHOUT Windows...

True, but only if you have the time to learn the command structure of DOS, and are inclined to do so. Learning the Mac interface is easier than learning DOS; the learning curve just isn't as long. And you *can* use a Mac without a mouse; *every* mouse function has an equivalent key command, though it's easier to use the mouse (and can be downright hard to find the equivalent key commands).

>: 4) Cheaper PCs offer more features and speed than a comparably priced Mac,

>Notably Leading Edge and Packard Bell... who while on your list supply
>free tec service and a 2 year warenty... (Last I looked)

Have you ever talked to one of their reps? If so, then you are far above the norm. I have had customers return these computers and get Compaqs because of the shoddy to non-existent customer support, not to mention 20% to 30% are returned within 30 days because they've broke down. The norm for tech support is to stay on hold for 20 to 30 minutes, and if you have a software question, you often have to call a 900 number, where you pay for sitting on hold. It can also be difficult to find an authorised service center for either ofthese computers, unless you live in a major metropolitan area.

When you buy a computer, be absolutely certain you are getting the service and warranty support you want with it. Many PC manufacturers (Compaq, Gateway, and AST to name a few) give excellent support.

Regards,
Tom

Yes, this is true, there are several ways to work around restricted access
to just about anything. I don't know exactly what type of action his
sysadmin took, whether it was limiting certain types of access, or
eliminating his account entirely. My guess is that he has disabled Sinclap's
permissions to all Usenet readers at the site. Time will tell whether or
not Peter has the brains (or the guts) to find a loophole and get back on
Usenet.

> Total $1499 | $1719

I thought you picked the Compaq with built in video?

8 bit stereo SoundBlaster Pro is only about $70, not $100.

I want the 15" flat screen monitor for $400. How do I do this on the Mac you picked since it's built in?

Networking. The Compaq comes with MS-DOS 6.2 and so basically has the same type of networking as the Mac's appletalk. It's called Interlink, let's you share harddrives and printers with another computer over serial line. It's somewhat limited, but for our needs it will work fine. $70 better not spent.

Why do I want to spend extra money reading Mac disks unless I have a Mac? And if I have a Mac, it will read PC formatted floppies, so what's the point? $150 better not spent.

Basically, it seems to me that you added a bunch of junk with the sole purpose of making the machine more expensive. That seems rather asinine to me anyway.

: Is the Amiga really that dead ?

Not at all.

: Come on boys, the Amiga can still have an amazing future !

Maybe.

: And as a HOME Computer it still has EVERYTHING out of the box:

: 1. Stereo sound (8-bit, but you will not really hear the difference to 16-bit)

Yes you will, Pinball Fantasies CD sure has much better sound
than it's 8-bit counterpart.

: 7. a really good native GUI. All programms are easy to learn and easy to use

Ten points, ease of use is better then Mac/PC equivalents,
a very relaxed environment.

: 9. A whole range of really good WP, DTP, DTV, CAD, Raytracing, MultimediaDB

Not for long.

: So, as a HOME Computer the Amiga is still IDEAL !

HOME yes, but Office? No. And it doesn't excel as
gaming-machine either

Very few want home computers nowadays, obviously not many
people like exploring new technology.

I will admit I feel I have been cheated. I have an Atari Jaguar
and I like it, I would feel better if the much published
and talked about software will finally come out.....

But, why does everyone "hate" Atari so much..you all sound
afraid of it and what it could do if it does succeed.

Yes, they should've released more software with the damn
thing but yet, SNES sucked for it's first year before
quality software came out and they even lied to their
customer's by "promising" a CD player for the SNES and
that's not going to happen now..so, why hasn't anyone
jumped on their backs like you all are jumping on
Atari's???

Again, I do not defend Atari completley due to lack
of software and the ever pushed back release dates (I had
to dig up Telegames phone # and order directly for Brutal Sports
Football!!) BUT, everything promised sounds and looks good and so
far I enjoy the few titles that are out there..

I will wait until after the holidays when the systems goto war
and then we'll see who's on top...I still say the Jag will be there
licking it's paws and maybe a few wounds....

later,
Frustrated Jag owner...

Why?
: Every single post is from a biased point of view, this one isnt...
I started with an unbies view but as the Mac Salesperson has pushed
I got out of hand.... You can ignore My preveous post as well as his...

: What you do is find someone with an Amiga,ST,MAC and PC and try them all out
: for yourself and make the choice that is best for your needs. Dont listen to
: anyone because their point of view is going to be biased towards the machine
: they own, try them out personally and then fork out the money for whatever
: machine you plan to use.
This isn't biese?

Ok it dosn't feal bise it dosn't look bies... But it includes mistakes
and bies...

What you need to do is....
1. Deside what you need a computer for.... This is inportent...
If you don't know what you need to use a computer for then you will
make a worthless choice later....
2. Find out the hype (I segested this in e-mail but it bounced)
The hype will be in ads by the companys that sell the products... Lissen
to sales people... they will feed you all the hype... This is so you
can filter it out later...
3. Ask friends of ALL computer brands (Atari ST,Amiga,Mac,PC,Unix, in some
cases even C-64, or much older computers will acualy serve you... but this
is the rare rather than the commen)
Make shure he has acualy done what he is talking about... and don't wory
to mutch about what he says about computers he has not had mutch experence
with... Only to his own personal experences....
Recognise the hype in what anyone says (friends will echo what a sale
person tells them some times rather than thinking for themselfs)

4. Get an inernet acount.......

Dose anyone realise we have been running on top of each other
to get this pore new user to get the corect Computer and said users
acount has vanished....
Don't you feal stupid when you find out your talking to a brick wall..

Jeff

hopper_t@msupa.pa.msu.edu wrote:

: No, the prices I gave very accurately represent the market in this area.
: Possibly other areas are more expensive for Macs and cheaper for PCs.
Then the prices in your area are inflated at best...

: > Compuq is very expensive and even THAY have mac beat....
Ummm I'll concead I realy do not know Compuqs curent pricing....
: Again, no. I was comparing actual street price (one of the best prices in
: the area, in fact) on both the Mac and the Compaq. Specific models were
: Performa 476 and Compaq Pressario 633. The 633 doesn't have the Mac beat,
: though they run at the same speed. Someone else said the sound
: card was 16-bit with speaker, microphone, and SCSI ports. This is mostly
: true, only it was a $99 Sound Blaster Pro, which is 8-bit, and that gives
: the Compaq the exactly same capabilities as the Mac.
I got a little hot under the coller before....
The comparison is still rather questionable....
: >: 3) Most people I've talked to who use both Macs and DOS/Windows on a
: >: regular basis find the Mac interface easier to use than either DOS or
: >: Windows (unless they're already adept at DOS).
: >Most of the people you talk to are walking into a Mac shop....
: >odds are they have already adaped to Mac or they wouldn't be there to start
: >with....

: Wrong again. We sell 4 Mac models and a dozen PC models from Leading Edge,
: Packard Bell, Compaq, and IBM. The people who have worked on both
: invariably enjoy working on the Macs more (bussiness, education, and home
: users).
I have a question.... whos sticker is on the store door?
In one Computer shop (I am shure this dosn't happen with you but
you will understand my sceptical view after you learn of my experences)
the store acualy told me they didn't sell Amigas anymore....
I looked over at an Amiga.. it was sitting next to an Atari ST
and said "Ok" and walked out....
Later I came back and they were no-longer selling IBMs says another
sales person.. (This time I was asking about IBM)...
But they all wanted to see me a Mac realy bad....
I admit most stores would never resort to such tactics...
Of corse that store lost a lot of sales for a year.... so much so
that they had to lay off a few sales people (hehe)....
Still many Computer stores selling both Mac and IBM
show an incredable bise agenst the IBMs they sell...
I have to go to a Non-Mac selling computer shop
to not get told how I'll have to get this latest gadget to keep

up with the power of the Mac... I barely keep up with IBM....
My Pc is just my termanl.... I upgrade it a little now and then...
But it's my toy.... My sereouse computer is Unix system...
But Unix systems can get very expesive...
It is my personal opnion that eventualy everyone will
drop what ever operating system they are using and refit there Macs
or IBMs to run vareous flavers of Unix...

: > Anyway I repeat... Windows sux... What is Windows to a PC?
: >Try using a Mac with out a mouse.... Windows down grades the system
: >Dos is better WITHOUT Windows...

: True, but only if you have the time to learn the command structure of DOS,
: and are inclined to do so. Learning the Mac interface is easier than
: learning DOS; the learning curve just isn't as long. And you *can* use
: a Mac without a mouse; *every* mouse function has an equivalent key
: command, though it's easier to use the mouse (and can be downright hard to
: find the equivalent key commands).
My point.... I knew about the keyboard thing... for some reason at times it
can acualy be easyer to tap a keyboard code.... Apple knew this much...
The learning curve isn't that bad for Dos... and it isn't as great as
it might seem for Mac.....
It's kind of funny... In my experence the learning curve is base on how
a person thinks.... MOST people think in Icons.... But for those that do
not have a picture stile memory Icons are hard to learn....
Those few find Dos easyer.... it's rare..... But Dos is also not
the only alternitive for a Pc... just one answer....
Windows is no answer at all
: >: 4) Cheaper PCs offer more features and speed than a comparably priced Mac,
: >: but usually sacrifice service and quality in the process (notably
: >: Leading Edge and Packard Bell, which offer lots for your money, but are
: >: prone to breakdowns). Not all inexpensive PCs are crap, however.
Oh forget what I said.. below.... I was fealy realy craby at that point
and what I said below is wrong anyway....
: >Notably Leading Edge and Packard Bell... who while on your list supply
: >free tec service and a 2 year warenty... (Last I looked)

: Have you ever talked to one of their reps? If so, then you are far above
: the norm. I have had customers return these computers and get Compaqs
: because of the shoddy to non-existent customer support, not to mention 20%
: to 30% are returned within 30 days because they've broke down. The norm
: for tech support is to stay on hold for 20 to 30 minutes, and if you have a
: software question, you often have to call a 900 number, where you pay for
: sitting on hold. It can also be difficult to find an authorised service
: center for either ofthese computers, unless you live in a major
: metropolitan area.
I didn't know an "atherised" service center existed for Packard Bell or
Leading Edge...
Acualy I have delt a little with Pacard bell... but not much....
To be brutaly honest I don't even use one.... I just had a question...
I service my own computer.... I alwase have.... I also service friends

computers for free.... Becouse that is just the kind of guy I am...

: When you buy a computer, be absolutely certain you are getting the service
: and warranty support you want with it. Many PC manufacturers (Compaq,
: Gateway, and AST to name a few) give excellent support.
Acualy it is best if you get it from a computer shop that suports the
computer rather than relying on the company... this is the best way to
deal with a PC compatable... but be shure the shop is acualy doing a good
job....
In one case a computer shop who garentys there computers for a year
sold a batch of bad motherboards.... (The buy the parts and build a system
there) they had to replace EVERY motherboard they sold....
They quit doing busness with that motherboard maker....
But getting them to do the job of replacing the motheboard.. or even
recognising the problem was a problem....
They also found a bad batch of sound cards.....
I like dealing with shops that test hardware before they sell it..
One example of that is a computer shop that will set up and run the Pc
for 24 houers running a dignostics program for all that time...
If it dosn't turn up with an error in 24 houers it's presumed to be
ok...
This can be a tad more expensive than going to a computer shop
with no tecnical support but it is also safer....

Apples own tenical support better be good.... The computer they
sell is more for beginers and they need as much help as they can
get....
and lets rember..... if your reading use net can you be called computer
ignorent?

Ps. I am still stupid.... eh...

|> Come on. I can tell the difference between 8-bit sound and 16-bit sound...
|> You can't??
If I want to hear a brilliant sound, I turn on my HiFi tower.
If I want to hear the radio news, I turn on the radio.
If I want to see television, I turn on my old color TV with integrated
speaker. The quality of my radio and my TV is shurely not as good
as the quality of my HiFi-tower and I think it doesn't need to be.
For good music I have allready my equipment and I don't want to hear my CD
from my computer, just because I could. And I don't want to turn on my
computer, just to hear a CD !
Also you should add the noise of the fan from the computer to the general
signal to noise ratio. This gives you a quality of nearly 8-Bit for
all available number of bits on every sound card.
For most of the stuff 8-Bit sound is OK. It has the same quality as my TV
and I think it does not need more.
16 Bit sound on a Computer is like having a 4WD on the Highway.
You could drive through the desert or the forest, but here in germany you
are not allowed to drive through the forest with a Jeep,
we have no deserts and the Highway is in good shape.
So why do people have cars with 4WD ?
If you offer people 64-Bit sound cards in full oktaphonie and
256-bit graphic boards with 1000 fps they will buy these things too,
even knowing, that nobody can hear more than 16 bits with more than two ears,
see more than 24-bit colours and resolve more than 30 fps.

Using the numeric keypad to control the mouse is like driving a car with
only your tongue.

The windows solution for keyboard use - giving everything a keyboard
shortcut - is at once both elegant and useful. It fails in graphical
drawing programs, but I cannot image drawing graphics without a mouse.

Hmm.. Yeah, I've heard this too..
> 2) They have never used Macs (and usually never used Windows, either).
I'll REALLY have to disagree with this. It takes NO brains to use a Mac,
and Windows is just plain slower than hell and is more complicated for a
new user. If you're new, use a mac, its simple. Nobody buys PCs as
their first computer for 'ease of use'...
> I will be switching in a year to a PowerMac. I feel that the Atari will
PowerMac sucks, only good for graphics. although it seems that's what
you'll be doing....
> way to go for a new computer purchase. The PC world lags far behind Apple
> for ease of use and user friendliness, and I don't see that changing anytime
True
> soon. I have an extreme dislike for DOS/Windows, as I find it cumbersome
Dos is well made, windows isn't. However, windows is pretty nice, I just
never use it
Dos is really simple if you know what you're doing. Plus the add on
programs are so much better... Like.. I hate graphic comm programs. and
I really hate text based comm programs running outta windows or on a
mac.. I hate running stuff in little windows that don't fill the screen
like dos software
> Apple's design standards; "plug-and-play" is becomming a buzword as "the

> will be buying either a Mac wanna-be that is years from catching up, or a
> UNIX or OS2 platform (and if that suits your needs, then go with it).
Haha! At first this started as an informative post, I've learned much
from you guys about Atari's for video, and Amigas, and other computers
that I thought were just obsolete. I really have no problem with
putting in modems, etc, it would not help my at all w/plug and play. I
do realize, however, that some people don't understand how to add new
cards, etc, and configure them, so that's fine.
'Chicago' is a wannabe mac. Correct. That's why it sucks. MS wants to
screw dos and force us to use some crappy GUI. Just like apple. Apple's
interface is easy to use; I just hate it. If you buy a PC now and run
dos, you'll be happy. If you buy a PC simply because you 'want a PC',
but want a graphic interface, you're screwed.

> similar Compaq.
Hahaha!!!!!!! That is the dumbest thing! Macs are a HELLA more expensive
that PCs! And I do not know ONE person who has EVER EVER EVER had their
PC break down. Same thing with macs, except our CD ROM PCs at school do
fine, and the Quadras with CD just fall apart and quit working, but I
wouldn't necessarily say its just the drive.. or the computer. They
get hard use. Sorry but my PC has FINE tech support, thank you very
much. This is all just stuff that's in your head, not based on fact.
And.. Why would you buy a compaq when you can buy a mac? Compaq's are
just mac's waiting for a interface like system 7. There's no reason
to buy one.
> Feature ($1499)Mac |($1099) Compaq
> --
> 8-bit stereo sound built in | add $100 + $40
8 bit sound cards are $50 or less.. speakers.. Well that might total
$100, true
> .28 Monitor built in | add $260
oops. Huh? Macs almost NEVER EVER have monitors in the price! That's
their biggest rip! They sell powerpcs for $3000 bucks, saying its a
great deal for a 70mHz system, and charge ya $600-$700 for an A/V
monitor, and $100 for a keyboard!
The Performas, as you note, do have monitors, though. So do Compaqs
> networking built in | add $70
> read/write both Mac
> and IBM disks built in | add $150
Its called shareware. How come I can't copy a pc disk in pc form to a
mac HD, and then move it to another pc disk? 'Cause it sucks. Shareware
for PC can do that.
> software built in | built in
> plug and play yes | no
Yup.. Although compaq is moving towards it, they don't have it yet.
After all, its just a wannabe-mac waiting for periphs and OSes to support
it
> set up time ~15 min | ~ 50 min
Huh? They're like, exactly the same. More like 5-10 and 5-10 minutes..
> ==
> Total $1499 | $1719
Hmmm
> The $40 added to the sound is to have a technician add it in so you
> don't void your warranty. Of course, adding the networking and replacing the
> disk drive to read Mac disks will also cost tech time, so the price may go up
> even further. And of course, the Mac still has advantages that no amount
> of money can give the Compaq (or any PC).
You don't need to put in a special FDD to read mac disks.
> The only advantage PCs have is the incredible amount of cheap (cheap
> price and cheap quality) software; there is more software available for under

> $15 than for the Mac, but lots of it barely works, so this isn't a big plus.
what the hell? The software is just as good as mac software, but less
expensive. We got Borland Quattro Pro v5.0 for $50. It is an AWESOME,
full-featured spreadsheet. just because of price-slashing doesn't mean
the software sucks. Don't base the quality of software on the price
> In my opinion, unless you need to meet one of the conditions I stated
> above, the Macintosh is the way to go; it is easy to use, easy to set up,
> easy to upgrade, easy to learn, has good customer support, is made with
> quality parts, and has a good warranty. And of course, most good
Yup, correct, sure, yup, yeah.. All right
> software is available for both Macs and PCs.
HAHAHA!!! Macs have SO MUCH LESS SOFTWARE than PC's!!!! They have so
LITTLE SOFTWARE! And the programs that PCs have that aren't for MAc
aren't the crappy things you refer to, its REAL STUFF
> I hope this helps you some, and if you have any other questions, let me
> know. The bottom line, though, is that you need to decide exactly what
> you will be using the computer for, and then go out and see what's available,
> get your hands on some machines, and decide what you like using best for
> yourself.
Which is probably a Mac. Hey, if you don't wanna spend too much time
setting it up, want to have a graphical interface and all the
pluses/minuses that come with one, go ahead. Just be prepared to pay
the price in software and Price. However, the Mac DOES have many built
in features that you won't have to worry about adding later, and there's
PLENTY of software selection, more that you'll ever need. But don't
expect a fast computer. Unless you do graphics and buy a powermac
I hate macs, but I have no problem with the people that use them.
They're a perfectly good computer for MANY people! I can understand
that. they're just WAY too expensive.. Lemme check the paper really
quick for an ad..
okay.. got one
Feature Quadra 605 AMD 486/DX2 66
Price $935 (2% cash discount) $1499
HDD 160MB 420MB
FDD 1.4MB superdrive 1.44MB
RAM 4 megs 4 megs
CD ROM Double Speed(Iguess) Double Speed
Sound card 8 bit 16 bit
speakers on a/v monitor included
Monitor 14" a/v $599extra 14" .28dpi, NI
Keyboard Godknowshowmuchmore$ Included
Software pack yes yes
cd pack no 10 CDs

Total cost $1635 $1499
Hmm.. Gee.. I wonder. And.. Hmm.. Modems for macs cost more $$.. just a
little, though. Networking.. Maybe $100 for a pc.. But its still
cheaper. and look at that! Quadra 605 is what, a 486 sx 25?? About
right. And the AMD is much better for less
The reason apple's cost ya mega bucks is because apple makes macs.

Nobody else does. No independant makers. And they're the ones to are
nice to ya, and give ya tech support w/o waiting in a 10-hour phone line
for some bozo to get off the line.. Because everybody calls apple.
Nobody calls the apple clone makers. There are none.

: Looks like same to me. Just in different angle.
: BTW, IMO there is nothing wrong with this diamond look a like...but is sure
: does look like diamond.

Ok. I'm sorry, my ascii art is not all it should be. The function key
picture should have been a little longer, or not so tall, therefore not making
it a diamond.
Sorry!

: Sure, but I have a wheeling that Falcon is the last home computer from Atari.

Hope not. After the success that the Jag will be (is?) then maybe Atari can
put some more computers on the production line.

: : Weren't Atari one of he first to use a GEM/GUI interface, the kind of
: : interface that everyone now wants???

: What kind of GUI is that?

Doesn't GUI stand for Graphical User Interface? If it does (and I'm sure it
DOES) then the Atari desktop, (even the old style, ie, no replacement) has
graphics in it. The delete function looks like a waste paper bin to me, and
the drives are pictures of filing cabinet drawers. The user interacts with
these via the mouse or keyboard, and the mouse pointer and a graphical arrow.
So the standard Atari desktop might not be the worlds best graphical desktop,
but it is GRAPHICAL, and the USER does INTERFACE with it. So it is a GUI,
although maybe a bit of a lame one by todays comparison, and it does it's job.
(hope that answers the question!!)

"superior" is based on opinion, relativistic frame of reference.

: > >anymore. The St was never any competition.
: > The ST beat the Amiga in sales terms and support for many years. Plus CBM
: > have gone now and Atari still live! Anyway, it's nearly 10 years old now
: > so I wouldn't expect it to be state of the art, would you? Now the Falcon,
: > that's a nice machine.

: hmm, the ST was ahead for the first year or two. The fact that the Amiga
: came from behind to dominate the market shows how it was technologically
: superior. The ST wasn't good enough to capitalise on the larger user

Wait...coming from behind shows "technological superiority??!?!
You are saying then that in 1982 the IBM XT with 128K, green screens,
etc... was superior!??!?! to the Atari 8bit from 1979 with 256 colors
4 voice sound?!?! and 3 years of software behind it?

: base and breadth of software - people still went for Amiga despite there
: being more support initially for the ST.

: CBM international may be dead but the Amiga isn't - yet! Theres still
: a good chance of it being produced by anyone of a number of potential

Sounds like someone is hoping ....desperately.

: buyers. As for the Atari home computer line - ie the Falcon, Atari
: have dropped it. They don't make 'em and they don't expect to earn
: any significant revenue from them. And with a much smaller userbase
: the Falcon has a much shakier future than the Amiga with a large user
: base to sustain it.

er... WRONG!!! Falcon is not a user base. Atari ST technology is....
So...that HUGE Amiga base outnumbers the St people?!?!

: As for the Falcon being 'state of the art', well a 16Mhz 030 with a
: 16 bit datapath isn't exactly the sort of processor you would expect

um..isnt the 030 32bit? Hmm.... not sure...but its used in
these Sun boxes.

: a modern computer to come with as the only option. Where are the 040
: models and faster 030 models? Atari just released the machine and said

: 'there you are' - no further R&D or high-end models. Even a big box

You also have no R&D anymore. =)

: machine with expansion slots would have been nice but there isn't
: even that - theres not an awful lot of room in a Falcon for expansion.

: gavan

I would just like to say that this "crap" will always be.
Being a Computer Engineer I have seen just about everything there is
about hardware. Which is better? St/amiga, IBM/Apple, 3do/jag, sega/snes.

To be honest.... snes I think has better hardware....but the sega
is a lot more fun. Apples work. And the amiga is just a game machine! =)
3do jag? well... the jag has much better hardware...

Maybe I shouldn't be saying any of this.... after all.... I own 12
Atari 8bit computers (all of which are used for productive use.....)
a few Xt's and 286's a dumb terminals...., a "state of the art" 486
(cough gag) which I use to play Epic Pinball, store atari8bit info, or run
unix. I have studied the Amiga and the ST. Own neither... don't want
neither.... but I would sure as heck by a ST before an amiga!
Why, it can run PC and MAC software! in addition to its own large
software base.

blah blah....

On which planet are PCs "a hellofalot" (I assume that is what HELLA means) more expensive that Macs? One note: I am talking about roughly equivalent PCs, not some butt-cheap luzer klone 25 MHz '486 vs. PowerMac 8100.

[more discussion deleted]

> oops. Huh? Macs almost NEVER EVER have monitors in the price! That's

Macintoshes can use the same monitors that PCs do, with an adaptor. You don't HAVE to buy Apple brand monitors. Also, there are no 70MHz PowerMacs. As for the AV monitor, it is a nice package IF you want something like that. I think I would rather buy the new 15" (plain) monitor, which supports multiple resolutions, and hook my sound output to my stereo.

> The Performas, as you note, do have monitors, though. So do Compaqs

Well, so can shareware for the Mac. There is a program (available via FTP to ftp.apple.com) called DART (Disk Archive & Retrieval Tool) that will read Mac & PC disks on any Mac with a SuperDrive. You can just make a direct (disk to disk) copy or you can save a disk image file (compressed) on you hard disk.

> > The $40 added to the sound is to have a technician add it in so you

You won't be able to read 800K or 400K Mac disks, just the High Density disks. Of course, you can argue that 800K disks are old-fashioned & not used any more, but the flip side is that the Mac can read high & low density PC disks but the reverse is not true.

Gee after arguing agenst this post now I find myself defending
it??? Ok I dissagree with the origanl poster but I also
disagree with this reply...
Reid Cameron Conti (jazz@connected.com) wrote:
: > In my experience (I sell Macs), most people who have used both Macs and
: > PCs like the Macs far more, and always prefer buying them. The only time
: Hmm.. Yeah, I've heard this too..
I have heard this and the reverse.... and a lot of how people using
Dos and mac prefer Unix... or some other computer....
: > 2) They have never used Macs (and usually never used Windows, either).
: I'll REALLY have to disagree with this. It takes NO brains to use a Mac,
: and Windows is just plain slower than hell and is more complicated for a
: new user. If you're new, use a mac, its simple. Nobody buys PCs as
: their first computer for 'ease of use'...
Windows is a pain in the neck.. But it dose take some getting use to Mac...
Still it's a lot easyer than Dos or any other operating system for a new
user...
: > I will be switching in a year to a PowerMac. I feel that the Atari will
: PowerMac sucks, only good for graphics. although it seems that's what
: you'll be doing....
PowerPc I belave was the wording in the origanl post....
PowerPcs are nice systems... Still have the Mac os but a new CPU... a risc
chip and is much faster than before...

: > soon. I have an extreme dislike for DOS/Windows, as I find it cumbersome
: Dos is well made, windows isn't. However, windows is pretty nice, I just
: never use it
I have used it.. Dos to... Dos is well made but due to it's simplistic
design and age it is combersom...
Windows is porely made....
: Dos is really simple if you know what you're doing. Plus the add on
: programs are so much better... Like.. I hate graphic comm programs. and
: I really hate text based comm programs running outta windows or on a
: mac.. I hate running stuff in little windows that don't fill the screen
: like dos software
Get a bigger moniter....
: dos, you'll be happy. If you buy a PC simply because you 'want a PC',
: but want a graphic interface, you're screwed.
OS/2, Linex (With Xwindows), GeoWorks (Not that useful on a PC unless you
own a zoomer) Desview... This is what comes off the top of my head....
Being a Unix type I prefer Linex with Xwindows... realy nice...
Of corse you can make the text so small most people can't read it...
For people who have very good eye site this is a nifty trick to play on

people... Of corse if you have vison problems big fonts are avalable
on ALL graphical interfaces (and 40col for Dos is also posable)
So many many graphical interfaces are avalable for Dos... Not Macs...
(due to a patent) but still just as good...(in most cases)
: Hahaha!!!!!!! That is the dumbest thing! Macs are a HELLA more expensive
: that PCs! And I do not know ONE person who has EVER EVER EVER had their
: PC break down. Same thing with macs, except our CD ROM PCs at school do
: fine, and the Quadras with CD just fall apart and quit working, but I
: wouldn't necessarily say its just the drive.. or the computer. They
: get hard use. Sorry but my PC has FINE tech support, thank you very
: much. This is all just stuff that's in your head, not based on fact.
: And.. Why would you buy a compaq when you can buy a mac? Compaq's are
: just mac's waiting for a interface like system 7. There's no reason
: to buy one.
I look down at my spare computer... a Compaq... running Dos.....
I rember somthing... The Compaq is sold with Windows already installed
This can be removed... Many systems are sold this way....
As for break downs... I repare computers for friends... as well as help
people out just becouse I feal like it.... PCs do experence breakdowns...
as do Macs... There is no judging Macs as "Breaking down more often"
I'd say somone didn't install the CDrom drives on the Macs corectly...
at your school... Pc support varys from comapny to company...
you can get crapy support or you can get supream support... shop around
Macs support is fine....
: > .28 Monitor built in | add $260
: oops. Huh? Macs almost NEVER EVER have monitors in the price! That's
: their biggest rip! They sell powerpcs for $3000 bucks, saying its a
: great deal for a 70mHz system, and charge ya $600-$700 for an A/V
: monitor, and $100 for a keyboard!
: The Performas, as you note, do have monitors, though. So do Compaqs
Some Macs and some Compaqs do have internal moniters...
and Macs with internal moniters get as cheap as $500 (last I looked anyway)
: PLENTY of software selection, more that you'll ever need. But don't
: expect a fast computer. Unless you do graphics and buy a powermac
: I hate macs, but I have no problem with the people that use them.
PowerPc... and the PowerPc is very fast... and for graphics ALL
Macs are very fast becouse the Mac dose most of the acual work in
hardware.. while the PC has to use software to figure out where every
pixcle gose... also the PC has to baby sit the VGA chipset the Mac
graphics chips pamper the CPU insted... So the Mac ends up doing more
faster when it gets into graphics... But thats becouse the CPU isn't
dealing with detales... The Pc dose... and has to deal with other detales
like the Vga chips have to be bank switched to get to diffrent features..
This slows things down...
: They're a perfectly good computer for MANY people! I can understand
: that. they're just WAY too expensive.. Lemme check the paper really
: quick for an ad..
: okay.. got one
: Total cost $1635 $1499
: Hmm.. Gee.. I wonder. And.. Hmm.. Modems for macs cost more $$.. just a

: little, though. Networking.. Maybe $100 for a pc.. But its still
: cheaper. and look at that! Quadra 605 is what, a 486 sx 25?? About
: right. And the AMD is much better for less
Mac uses the same modems IBM dose... (The external anyway...)
All my modems will work on any Mac... no problem.....
So eactly what do you mean when you say a Mac Modem is costs more than
an IBM modem when there is no distinction between Mac and IBM modems...

Jeff

Hmmm.... Lets see.... I'll get realy sneaky and refere to software that
there is only one or two versions of on the IBM...
an AI wordproseser with an AI spell checking system than will corect
your spelling as you go and over time will do a better and better
job of doing it....
(This is my favret wordproseser by the way)

and how about this...
Forth programing laguage... my favret programing laguage...
There are all kinds of versions of Forth for the IBM....

Here's a one of a kind..... a Sun Sparc corss compiler...
Make and test programs for the Sun Sparc...

In fact there are loads of cross compilers for IBM....
Amiga, Atari ST, CP/M etc...
Also the Termanl program market for Macs is very limited...
While we on IBMs take ANSI graphics for grated Macs usualy do not...

There are usualy only a few of each kind of program for the Mac
while the IBM usualy has millions of any one class of program...
Mind you if you just grab the most expensive IBM program your gona get
crap becouse far to many people think the price directly efects the
power of the program.. It acualy directly reflects the ego of the programer..
But you still have to do some reasirch to make shure what your getting
dose the job you need... becouse crapy software dose exsit for IBM...

How ever with Mac while there is less crapy software there is also
less good software... and at times you may not even be able to find a good
program for what you need.... for example... while there are good
termanl programs for the Mac they are very hard to find as people who
know about then go hunting them down...
NovaLink by ResNova as I understand is a good mac termanl....
But good IBM termanl programs are commen....
ProComm Plus is considered realy pore quality for an IBM termanl
but outstrips most mac termanl programs....
Commo is great but complex... Boyan lacks a graphical interface...
but is still powerful and easy to use (To spite the lack of a graphical
inerface) Telamate is also very populer for IBM... and thies are
only one ones I have used... There is ByteComm, BitCom, Telex,
and many many others....

I picked Boyan becouse it works for me... Most people use Telamate
but not all...

Another example... the one I will exit with....
With Mac the options for CADing is AutoCad or nothing...
With IBM you can use DanCad, AutoCat, 3dCad etc the list gose on and on
and on....

and after reviewing that list the best of those programs is AutoCad...
and as it turns out it runs Better on a Mac....

Software selction isn't the last word... is what you need to do...

and you will have a wider selection of software if you havn't gotten a
computer yet... go out look and see what program dose what you need the
best and on what system dose it do the best job.....
Get that computer,

Bye!

If it's your favourite word processor because it has AI spell checking,
WHY don't you ever use it??

Here's my recent PC vs. Atari experience.

I'd developed a certain method for numerical integration,
and was very pleased with myself when it took only 13 minutes
to integrate a 20-dimensional probability density, using APL68000
on a 4Mb 1040STF [APL68000 is a very well-regarded implementation].

When I ported the code to APL*PLUS on a 486DX/33, with no rewriting,
the same calculations took 11 seconds.

I don't like DOS, Windows, memory (mis-)management etc., but as a
computer *user*, given the availability of APL, visual programming,
Linux etc., I can almost ignore them.

The original PC XT had 80 column display and was 16 bit (sort of) as
oppposed to the 8 bit of the XL. With CGA the gfx rez was also higher.
The XL was much better for games, but for business the PC was always
the best bet. Plus it had the IBM name which made it a cert.

> : CBM international may be dead but the Amiga isn't - yet! Theres still
> : a good chance of it being produced by anyone of a number of potential

> Sounds like someone is hoping ....desperately.

Its quite a reasonable hope. There are a number of interested parties.
Whether or not the new owner will support the Amiga or just take the
technology remains to be seen. Certainly the C=UK management buy out team
are committed to supporting the Amiga.

> er... WRONG!!! Falcon is not a user base. Atari ST technology is....
> So...that HUGE Amiga base outnumbers the St people?!?!

Yep, the Amiga base outnaumbers the ENTIRE Atari 16/32 bit line by
quite a bit (1 1/2 million Amigas in the UK ALONE). Plus of course
AGA amigas vastly outnumber Falcons.

> : As for the Falcon being 'state of the art', well a 16Mhz 030 with a
> : 16 bit datapath isn't exactly the sort of processor you would expect

> um..isnt the 030 32bit? Hmm.... not sure...but its used in
> these Sun boxes.

The 030 in the Falcon has only a 16 bit memory connection thanks to
the way the Falcon is designed. Sort of like a 68030SX set up.

> : a modern computer to come with as the only option. Where are the 040
> : models and faster 030 models? Atari just released the machine and said
> : 'there you are' - no further R&D or high-end models. Even a big box
>
> You also have no R&D anymore. =)

No C= R&D which puts the Amiga in the same situation that the Falcon
was in since launch. Since the Amiga has a larger userbase, 3rd party
r&D is better, Check out the Warp engine : 040 at 40Mhz with a FAST
SCSI II port (9.1 megs/sec from a 2.1gig seagate barracuda). It plugs
into the processor slot in the A3000 and A4000.

The Amiga big-box machines all have processor and 32-bit expansion
slots. There isn't much scope (by comparison) for expansion in the Falcon.
Plus of course there are 040 Amigas officially available. The only way
to do it with a Falcon is with a mythical 040 hack...

> Maybe I shouldn't be saying any of this.... after all.... I own 12
> Atari 8bit computers (all of which are used for productive use.....)

Check out the Amiga - its a turbo-XL! (really, it was designed by the
same guy - the late Jay Miner)

> a few Xt's and 286's a dumb terminals...., a "state of the art" 486
> (cough gag) which I use to play Epic Pinball, store atari8bit info, or run

> neither.... but I would sure as heck by a ST before an amiga!
> Why, it can run PC and MAC software! in addition to its own large
> software base.

Amiga - Emplant/Amax 256 Colour, System 7.
Pc - up to 50Mhz 486 bridgeboard with ISA slots in big box machines
for PC add-on cards (SVGA, network, etc)

Off the top of my head:
If the APL68000 runs about the same speed as a Motorola 68000, then it should be doing around 0.8 MIPS. Assuming the 486DX/33 (notice it has an FPU built in) runs about the same speed as a MC68040, then the DX is probably running up around 24 MIPS. That means a 13 minute calculation shouldn't take more than about 45 seconds on the DX. Undoubtedly, the pressence of the FPU in the Intel processor speeds this up even more. Of course, you'd be surprised how much faster the Pentium or PowerPC would be compared to the DX (not so great as between 68000 and DX, however).

>I don't like DOS, Windows, memory (mis-)management etc., but as a
>computer *user*, given the availability of APL, visual programming,
>Linux etc., I can almost ignore them.

This is a perfect example of picking the right computer for the job; in this case, picking the one that does the most mathematical computations. I would certainly prefer the DX over my MC68000 Atari for mathematical computation, though I prefer the Atari for wordprocessing and the like.

Gavan,
Apparently you are not keeping up with the Falcon scene as far
as upgrades go. Wizztronics has just released a 040 board
(available from Toad) and I believe there are many other
accelerators (Sonic....). There are also tower cases available
for the Falcon. You also seem to be forgetting the nifty
processor direct slot which has a nice 286 emulator for it
(with a 486 emulator on the way). Of course that 1200 case
is sooooo nice.... :-P. Don't get me wrong.... I like the Amiga....
but I've also never regretted switching from the Amiga to the ST.
IMO, TOS is much better than Workbench. Just the way Workbench
LOOKS annoyed the heck out of me. I realize this is subjective....
Are there any alternative desktops for the Amiga like there are
for the Atari?

I didn't get the post (he's in my killfile) but he was on
the amiga.advocacy group posting the same thing (only about PCs
vs the Amiga). Its a fair bet he's just some maladjusted dork
looking for attention and is trolling around all the .advocacy
type groups.

The DX/33 will probably NOT match a 25Mhz 040 for either integer
or floating point maths. A DX/33 runs at approx 16 MIPS depending
on what benchmark you use.

Hope not. After the success that the Jag will be (is?) then maybe Atari can
put some more computers on the production line.
==========

Seems to me that Atari has planned to support its existing machines only as far as there is demand for parts and service and not introduce any new models. They have staked their future on the Jag. It probably wouldn't have been too hard to come out with a TT040 built around an LC040, or perhaps even a full blown one, but they haven't done that. They also seem to have failed to do anything to retain/gain market share. The episode with the STfms in the UK shows what I mean. They don't seem too anxious to sell computers.

on a 4Mb 1040STF [APL68000 is a very well-regarded implementation].

When I ported the code to APL*PLUS on a 486DX/33, with no rewriting,
the same calculations took 11 seconds.
==========
Probably has something to do with the fact that for numerical stuff a 486 is a zillion times fater than a 68K. :-) Which causes me to wonder why the hell Atari hasn't come out with a good fast number-crunching machine. Like one with an 040. (frankensteinish third party upgrades don't count) As time goes by the Ataris will have less and less competitiveness.

Some people prefer to use their computers, rather than tinker with them. All
the customization of Emacs 19 still leaves it somewhat inferior to BBEdit for
text editing tasks.

Does anyone on the net actually HAVE any of these 040 upgrades?
They seem to be pretty thin on the ground to me. And how do they
interface to the Falcon? By slotting into the existing 030/882
sockets??

> There are also tower cases available
> for the Falcon. You also seem to be forgetting the nifty

Only 286? The Amiga has 486/50 bridgeboards NOW. But not for
the A1200 however. Does the tower case have proper 32-bit expansion
slots a la Zorro 3?

> Of course that 1200 case

> Are there any alternative desktops for the Amiga like there are
> for the Atari?

Try Magic Workbench. Its an updated look, no extra functionality.
It looks superb in hirez on a good monitor - MUCH better than the
std wb (I hope you weren't comparing with WB1.3 BTW). For extra
functionality ToolsManager is an excellent object oriented program
launcher. Both total freeware of course - just d/l them off any
Aminet site on the net.

For more flexible file management - Directory Opus, about 50 dollars
or pounds.

|>

Well you really do not have to open the target folder to copy/move a file.
You must have an icon that points to the folder visable. (Either a disk icon
or a folder open that contains the icon of the target folder) This is the same
as a MAC.

If what you are complaining about is that the Atari desktop performs
copies by default, as opposed to the MAC which will perform a move or
copy depending upon whether the target folder is/is not on the same
disk drive/partition, then tough.

Making a copy of a file, on the same hard drive partition, on the MAC is
a royal PIA. My favorite is when the MAC owner has to drag a file from
the hard drive to a floppy, forces a copy because it is not the same
drive/partition, the drags the file from the floppy back to the hardrive
in the final resting place, again forcing a copy not a move, then drags
the file from the floppy to the trash-can, then empties the trash can
(to really get rid of the file on the floppy).

This is known as the MACs user-friendliness :P

Brian
p.s. I know what keys to hold down on the MAC to force it to copy the
file versus move it. Most users do not.

If you bothered to read what I was replying to you would see that the person specifically asked why they couldn't " copy a pc disk in pc form to a mac HD, and then move it to another pc disk?"

As you will notice, my reply directly answered that question.

[deleted: discussion & request for apps that exists only on the PC]

> (This is my favret wordproseser by the way)

The Mac has word processor that correct your spelling as you type. Frankly, I don't see the need for AI in a spell checker. Either a word is

misspelled (not in the dictionary) or it isn't. I don't know what AI would do for you; make up new words, maybe. It is possible that you are refering to grammar/sentence structure checkers, which would use some AI to learn the way that you write & make suggestions. Those exist for the Mac as well.

> and how about this...
> Forth programing laguage... my favret programing laguage...
> There are all kinds of versions of Forth for the IBM....

There is one at the sumex-aim archive (& mirror sites) called Mops as well as one called PocketForth and one called Gambit that implements the Scheme (?) dialect of Forth. These are all shareware, there may be commercial Forth compilers for the Mac.

> Here's a one of a kind..... a Sun Sparc corss compiler...
> Make and test programs for the Sun Sparc...
>
> In fact there are loads of cross compilers for IBM....
> Amiga, Atari ST, CP/M etc...

I won't comment on cross compilers, since I prefer to work in the environment that I am compiling for.

> Also the Termanl program market for Macs is very limited...
> While we on IBMs take ANSI graphics for grated Macs usualy do not...

I use a SLIP connection, so I have little use for a terminal program. I do know that there are several out there, including some shareware.

> There are usualy only a few of each kind of program for the Mac
> while the IBM usualy has millions of any one class of program...

How many of one kind of program do you need? If you have about 5 that are competing for the same market (e.g., mid to high end word processor) that should be all the competition that you need to keep the programs inovating. Even 2 or 3 should be enough.

Having the default action as "move" makes more sense. Think about it -- when
you pick up a piece of paper on your real desktop and drag it around, does a
copy magically appear, or does the paper simply move to a new location?
(I seem to remember an option which allows you to change the default action
to move instead of copy. Is that correct, or am I imagining it?)

Actually, it's known as user stupidity. To make a copy of a file on a Mac,
select the file, then either choose "Duplicate" from the File menu, or press
Command-D.

>Brian
>p.s. I know what keys to hold down on the MAC to force it to copy the

This seems as good a thread as any to post this. I recently saw a demo of the new Fractal Painter on a Mac, (It will also be on the PC).

It features animation support and animated brushes, something all you Amiga guys have been familiar with for say, six years. Except Painter is 24 bit with alpha channels, has some amazing paint and mask capabilities and can produce professional results at any resolution.

I heard someone ask about Amigas, and the demo guy mentioned that two of the guys responsible for Painter were former Amigans who's demand for functionality is higher than the average Mac programmer or user.

Not that Mac users are slouches, or Mac programmers, but Amigas have always had animation, and have had things like onion skin (or lightbox) and integrated animation/paint packages.

Anyway, another example of the Amiga diaspora and its influence on the computer world at large (did I mention that 4 out of 5 programmers on the Onyx systems where I work are also ex Amigans?).

I like Painter because it is also available on PCs, minimizing the software availability in which platform issue.

In another report that I got, there will also be Quicktime authoring software available on the PC (RSN, predicted for fall).

But, a computer is not a real desktop. Move is a potentially destructive
action. Copy is better. And either is better than the Mac way of "I know
what you want to do, let me decide"

I'd like it if the "Copy FIle" dialog on the ST allowed you to click on
the word "COpy" and change it to "Move" or "Copy & Rename" or "Move & Rename".
Then I wouldn't have to worry about holding down keys...

The latest news is that former C= UK managers are making
a bid to buy a the rights and other things of C= International.
C= UK is in bankruptcy too, but the bid, again is by former
C= UK manager with the financial backing of a non-disclosed
company (or financial institution of what have you).

This is not a rumour, but a truth, as an interview with
Dave Pleasance was published in more than 1 Amiga magazine.
Now, their plans are to resume manufacturing A1200's, CD-32's,
A4000's for the next christmas, but for now they will concentrate
on the UK market only (and probably other selected parts of Europe).

They also stated that they indeed want to continue further
research & development (AAA chipset someday maybe? :-)).

Well, I am not holding my breath too much for it, but
the latest deadline for the final bid I heard was this very month,
the end of it- August.

I know this is ATARI advocacy... but you asked for info :-)

Isn't the Finder/GEM Desktop supposed to represent a real desktop?

> Move is a potentially destructive action. Copy is better.

How is Move a potentially destructive action? If you make a mistake, just
move the file back!

>And either is better than the Mac way of "I know what you want to do, let me
>decide"

This is an idiotic statement. The Mac works almost exactly the same,
it's just that the default action is different. On the Atari, if you drag a
file, it gets copied instead of moved -- is this a case of "I know what you
want to do, let me decide?" On both the Atari and the Mac, you hold down
a key to override the default action. On the Mac, you Option-Drag to copy,
on the Atari, you Control-Drag to move.

How can "either" (By either, I assume you are referring to either Move or Copy)
be better than the "Mac way" when to move the file *is* the Mac way?

The Mac's method of copying also has the benefit that you can copy the file
to its own directory -- with the Atari you have to copy a file to another
directory, then move the copy back.

! ================================
!
! That's still 2 steps too many. And BTW, how come you have to hold down a
! key?

Simple. The default option is to copy, not move. To copy a file,
simply drag one icon from one window to another. If you prefer the
move op to be the default, run a desktop with that operation as the
default.

As for "2 steps too many". Exactly how can you do it in fewer steps ?
If you have the source and dest windows open already, it's a simple
op, if you haven't, then open them. If you want a CLI version, run
an alternative desktop, or if you're running a multitasking OS, run
a CLI in a window. Now exactly how can you improve on this situation?
(Hint: Answer = "You can't").

Simon.

I have a 1040 Mega STE (4 meg RAM/50 meg Hard drive) for sale. The package includes a 14" Atari Super VGA monochrome monitor (compatible w/IBM PC/, PC/AT and PS/2), Spectre GCR 3.0, Migraph hand scanner (with TouchUp), Golden Image floppy drive, and SupraModem 2400. Lots of software including PageStream, DataLIte 2, WordWriter, Flash, TrackerST, and more.

If interested, make an offer and e-mail to MASONA on AOL or to:

aldricm@firn.edu

Hi, I am new to all this internetting stuff however, I do have one small
fairly innocent question. Exactly what is the point of arguing among
yourselves re. which is the better machine? I have both machines and think
that each has its merits, both OS's on the other hand are fairly naff
compared to Windows or OS/2. The only thing that pissed me off good style is
the way that both Atari and Commodore treats their customers (especially
Commodore) Its a real pity that Commodore have got themselves into so much
strife, the Amiga certainly deserves to be "owned" by a better management team.
I should say however, that both Commodore and Atari are guilty of resting
on their laurels, lets hope that the Jag is a success, I hope so, I forked out
over 400 pounds last December on a USA import machine.

To be perfectly honest, after mistakenly buying a PC emulator for my Amiga I have come to the conclusion that if I want to run PC software I would rather have a bona fide PC. This goes for all the others. Emulators sofware or hardware are too much of a compromise expecially now that most really good quality software on almost any format of Computer requires loads of RAM, a big hard disk and a fairly nippy processor.

The spelling in general is atrocious, which does not say much for the
MAC spell checkers you lot are supposedly using. It may be of course that I
am not used to the way you Americans spell (color instead of colour for example)

a) The Amiga does NOT have 486/50 bridgeboards, for the Vortex boards
are ALL based on 16bit processors, the fastest one on a Cyrix "486".
b) These boards are only for sensible Amigas, not for games machines
like the 1200/CD^32. Zorro 2 required.

I've said it before, I'll say it again.

My accelerated 4000 can...

- format floppies.
- download a file.
- transfer files.
- generate a fractal.
- Play a game of "Hired Guns".
- print a document.

All at the same time with no slow down whatsoever. When the PC and Mac can do that I'll string my gonads with fuse wire and jump off a bridge.

The ONLY thing that Mac and PC users can say about the Amiga is that there's no Commodore. Boohoo...

With the exception of playing a game of "Hired Guns", a PC running
OS/2 2.2 CAN do all that simulteneously, and more. It can also play
Hired Guns as well, if Hired Guns is available for PCs.

>The ONLY thing that Mac and PC users can say about the Amiga is that
>there's no Commodore. Boohoo...

You need to take a visit to the 1990's. There is FAR more that
PC and Macs can do that Amigas can't do, then Amigas can do that PCs and
Macs can't do.

No, it can't, James. At least not if the fractal program is trying to get
as much CPU time as it can.

If you took out the rest, I'd agree that your Amiga can do it. On the other
hand, so can the LC575.

Any fuse wire handy? I'm sure you'll have no problem finding a bridge.

First of all... BIG DEAL. I did this stuff under Windows, OS/2, and MacOS. It took a lot of fiddling under Windows, OS/2 does it just fine, and MacOS was slow as hell. But they did it. I hate Windows and DOS but they'll do that. None of the above is what real multitasking is all about. The Mac OS sucks rocks but I'd run that before I'd run Windows I think. Ick, I'd hate to have that choice in front of me. OS/2 is the right idea done very poorly.

>>All at the same time with no slow down whatsoever. When the PC and Mac
^^^^^^^^^^^^^^^^^^^^^^^

That is bullshit. Every task you add to *ANY* CPU on the planet slows it down, end of story. It may or may not affect what the user sees depending on the mix of tasks.

It's stupid to promote an impossibility in order to make your choice of computer look good. The day you get a computer than can divide itself among tasks with no slowdown you'll be Nobel Prize material and wealthy beyond your wildest dreams. It simply is not possible. The 4000 is some nifty hardware but it is still bound by mathematical and physical laws.

I might be willing to give that to you if it has more processors than tasks and near 100% efficient symmetrical multiprocessing though.

>>can do that I'll string my gonads with fuse wire and jump off a bridge.

Well you better start because I can load my machine up more than that *AND* have several people logged in in addition to:

* ray tracing
* and recompiling my kernel

My main system is a 486DX/40mHz running Linux 1.1.19.

Well, if it ain't old MB still calling from Iowa. Graduated yet?

Yes, a PC with OS/2 can do all that, but it does it clumsily, slowly, and
while consuming computer resources at a rate even UNIX would envy. I use
an Amiga. I use OS/2. The Amiga is a sprinter, the OS/2 machine is a
bloated hog. Even so, it's miles ahead of Windows

: > 4 voice sound?!?! and 3 years of software behind it?

: The original PC XT had 80 column display and was 16 bit (sort of) as
: oppposed to the 8 bit of the XL. With CGA the gfx rez was also higher.
: The XL was much better for games, but for business the PC was always
: the best bet. Plus it had the IBM name which made it a cert.

First of all, if you ever learned of the history of big blue you would
not be holding it up so high. Nobody there could build a PC..NOBODY...
so many times they failed..even Atari offered IBM in 79 to have IBM
slap their name on the machine...but they declined.
They finally gave the project over to some people who were not restriced
to IBM policy in anyway... they could do whatever they liked...even obtain
parts from outside IBM...(a terrible thing at the time).

And the night before the great unvailing of the PC, IBM had to fly people
all over the place to repair the power supply fan because those brilliant
engineers realized that if too much dust built up on the blade it shorted
to the power cage. DUH...good design guys!

CGA res is higher than what?

16bit? er... 8086 was sorta, ..not the 8088. sorry..and thats what they used.
For business? well..lets see....IBM is god to everybody without a brain
so, yeah..it became more popular. But dear god...what crap IBM did develop.

I seem to remember that early 030 Falcon boards worked by plugging
in to the 030/882 sockets on the motherboard which is dodgy to say
the least. I'm glad to hear that newer models use a proper expansion
bus.

Yes, and with the 25mHz Cyrix 486 board you just replace the processor
with the 50mHz clock doubled version. You can also do this with the
official C= 386SX bridgeboard. I've heard of some German company
shipping 50mHz cyrix bridgeboards direct.

And just what makes the A1200 a 'game machine?' Is it software like
Pagestream 3, Imagine or Scala? Of course, it _does_ have lots of
excellent games but I don't think any owner is going to complain
about that..

> > For more flexible file management - Directory Opus, about 50 dollars

Higher than what was on the XL series - 640x200 in monochrome
was considered quite good in those days. Even 320x200 in those
yucky 4 colours was better than the XLs 320x192 in monochrome.

> 16bit? er... 8086 was sorta, ..not the 8088. sorry..and thats what they used.

The 8088 is like the 68008 in some ways. Externally 8bit but with
internal 16 bit design. (32 bit in the case of the 68008). Although
it stinks as the basis for a modern processor, its still a lot
better than the 6502 was.

Parties involved are some former C= US and UK managers, Philips,
Amstrad and Samsung. The common wisdom is only the former management
are interested in keeping the Amiga line, the rest only want the
technology for set-top boxes (or maybe to kill off a competitor
in Philips case..).

The ex C= managers involved are actually quite,shall we say,
'competant' as opposed to much of C=s former team. They have the
backing of several large UK financial institutions and claim that
they have large advertising and r&d plans and money to back them.
We've heard that before however (as have Jaguar owners from Atari)
so it remains to be seen how things go.

Deadline for decision of who gets company - 31 August....

C= Uk are still trading as they were seperate from C= - but they
are still part of C= intls _assets_. The bid is as you say from
former and current C= Uk and US staff and not C= UK itself (which
would be impossible)

Sadly this does not appear to be the case: Mr Felinoid genuinely can't
spell or write grammatical English. What *do* these people learn at school?

Why is it that the commercial Internetters from the UK, who mostly use
Demon, have a grasp of English grammar and spelling that is so much better
than their US counterparts, who mostly use AOL? The World wonders...

Have you heard of Linux & A/UX? My crappy 486 can do that now with Linux & my old Mac used to be able to do it with A/UX. My RS/6000 can also do that with AIX (and hopefully there will soon be AIX for the PowerMac).

Here's some fuse wire ;-)

[amiga doing a lot of things without slowdown]

RW> No, it can't, James. At least not if the fractal program is trying
RW> to get as much CPU time as it can.

It is not a question whether the fractal program _wants_ CPU time - if I put it on a low priority level it gets whatever is left over after the other processes have taken what they need.

If the priorities are set correctly I can multitask without slowing down interactive tasks. Of course, since the amount of cpu power pr time unit is constant the non-interactive tasks are going to suffer.

Thus, the download and transfers are probably put at a high priority. It is rather important that a task using the serial port gets the time it is asking for.

The game is at a priority just below. It is interactive and has to respond quickly.

The floppy format uses no appreciable amount of CPU time and it does not really matter if it is slowed down a little, so that could be put at an arbitrary priority.

The printing is at a rather low priority because even cheap printers have at least 4kb buffer. Thus even at a low priority it would be easy to ensure that the printer is always printing at full speed.

The fractal generation is at the lowest priority. The other tasks are using constant amounts of cpu power, this one is eating all it can get. It should get only what is left over when the other tasks have taken their share.

RW> If you took out the rest, I'd agree that your Amiga can do it. On
RW> the other hand, so can the LC575.

If the LC575 is a mac then it cannot do it. Prioritizing tasks the way I did above requires preemptive multitasking. Moreover, if I want to be sure that the fractal generator are only getting left-over cycles, a realtime OS is needed. AmigaOS is realtime, UNIX is not. I think OS/2 is realtime and I have heard that Windows NT is.

UNIX has many strengths but I would have liked the option of switching the multitasking to realtime. However, that would more or less defeat the multiuser features, since any user would be able to suck all the CPU time.

> Hired Guns as well, if Hired Guns is available for PCs.

Yeah, right! We have very different OS/2 experiences. I tried OS/2 on
my PC (A standard 486DX33 with 16Mb ram and a GUS) and it crashed more
often than WB1.3! I used OS/2 2.1 and it crashed two times just during
installation. But it's such a pleasure to install all those about 20
disks a couple of times, right!

And then when the installation finally worked, the rest of the system
kept crashing. Runnig different DOS programs crashed it, runnig a game
installation crashed it and runnig most of the games on my HD crashed it.
Out of all the games I tried, only the demo version of raptor worked.

No, I'd take my amiga 3000 over a PC with OS/2 any day.

> You need to take a visit to the 1990's. There is FAR more that
> PC and Macs can do that Amigas can't do, then Amigas can do that PCs and
> Macs can't do.

If OS/2, Chicago and System 7 is the 1990's I'd rather skip the 90's or
return to the 80's.

Sure, Amiga OS isn't perfect but I suits me better than all of the above.
And my PC? It has linux installed, of course. A REAL OS!

Actually the Best Sequencing Package In The World is called KCS/Omega, and it was originally developed for Amiga... but it does run on Ataris. ;>

Actually you don't have to hold down Ctrl (or Alt) for the entire duration of the drag, it only has to be depressed at the moment you release the mouse button.

Oops sorry, that was a practical hint conveying useful information. Better move to another newsgroup. 8>

Bloody amatures. If you use "Wzchic koychue numcher reeeek" (Note extra "e"), you then
simply
need to add the name of the desired person to the cast and you get that person eg
"Wzchic koychue numcher reeeek Winona Ryder". Much better than having to remember a
seperate
spell for each person.

And the PC leaves BOTH the ST and AMIGA in the dust. As I recall, the
PC clones have over three-quarters of the personal computer market.
What is the market share of the AMIGA? About 1% or less. That is
hardly "supremacy" in my book. And if you are refering to technical
supremacy, the supreme machine would be a DEC ALPHA or some other RISC
workstation, definitely not the AMIGA. Before putting down other computers
like the Atari ST, AMIGoids should put their own house in order (such as
by getting the Amiga in the hands of a company that A) is solvent and B)
knows how to market computers). Till then, AMIGoids should leave other
computers alone.

It is not a question whether the fractal program _wants_ CPU time - if
I put it on a low priority level it gets whatever is left over after
the other processes have taken what they need.

Hence, it slows down.

>RW> No, it can't, James. At least not if the fractal program is trying
>RW> to get as much CPU time as it can.

>If the priorities are set correctly I can multitask without slowing
>down interactive tasks.

No, you don't NOTICE the slowdown. User interface response doesn't suffer.
But everything else does. Also, an OS which maintains responsiveness under
a load does so with high-granualarity and is less efficient than one which
give priority to load-handling rather than responsiveness.

> Of course, since the amount of cpu power pr
>time unit is constant the non-interactive tasks are going to suffer.

Sherlock!

>Thus, the download and transfers are probably put at a high
>priority. It is rather important that a task using the serial port
>gets the time it is asking for.

Yeah, that's why they usually run on in interrupt. Easier to do than
polling them.

>The floppy format uses no appreciable amount of CPU time and it does
>not really matter if it is slowed down a little, so that could be put
>at an arbitrary priority.

Most floppies are on a timer and must never miss an interrupt and each
individual operation of the format must usually be atomic. Floppies
aren't like a hard drive where you can send a command go do something
else. The CPU must usually keep track of it pretty closely. A lot of
them (even non IBM/PC/ISA Intel) use timers to control the drive.

>The printing is at a rather low priority because even cheap printers
>have at least 4kb buffer. Thus even at a low priority it would be easy
>to ensure that the printer is always printing at full speed.

Unless you have a fast printer. That theory doesn't hold water for a
PostScript, raster, or very fast line printer.

>The fractal generation is at the lowest priority. The other tasks are
>using constant amounts of cpu power, this one is eating all it can
>get. It should get only what is left over when the other tasks have
>taken their share.

Sure... in a perfect and nonexistant world.

>RW> If you took out the rest, I'd agree that your Amiga can do it. On
>RW> the other hand, so can the LC575.

>If the LC575 is a mac then it cannot do it.

I don't like Mac's but I've certainly done all you mentioned (minus the game) on a very low-end Mac. I think what you mean is it won't be very fast and efficient. Agreed.

> Prioritizing tasks the way
>I did above requires preemptive multitasking.

Plenty of OS's in the 60's and 70's did so without preemtive tasking. Simple timesharing can priortize to hell and back.

> Moreover, if I want to
>be sure that the fractal generator are only getting left-over cycles,
>a realtime OS is needed.

Clueless bullshit.

> AmigaOS is realtime,

Bwahahahahahahahhahahahahaha! If it was then people wouldn't spend $$$$ on things like QNX and VxWorks. Do you make this crap up as you go along?

>UNIX is not.

Standard UNIX, no. But it doesn't keep it from doing what your Amiga does. Given that I do it every day, day in and day out, year after year I'd say you don't know much about UNIX...

>I think
>OS/2 is realtime

Or OS/2...

>and I have heard that Windows NT is.

Or NT...

>UNIX has many strengths but I would have liked the option of switching
>the multitasking to realtime.

Be nice if Amiga's had it too. If you want real-time get Solaris 2.4 with real-time extensions, QNX (great little OS), VxWorks, and a myriad of other offerings. Amiga OS can be hacked up to do some things but then so can any UNIX you have source for.

There are free real-time OS's that are far better than Amiga's OS for that sort of thing.

>However, that would more or less defeat
>the multiuser features, since any user would be able to suck all the
>CPU time.

No doubt about it now. You have no idea whatsover what it means for an
OS to be real-time.

Also, were I work we build real-time systems with plain-vanilla UNIX.
Only when we are unable to garantee real-time response to I/O are we
forced to use a real-time OS. Everything else is kept real-time by
clever programming, multiple CPU's, and other tricks. Our software
tracks it's cycles and responsiveness so we know if we cannot meet
real-time goals. At that point it's because some of our development
machines just aren't fast enough. Even if they had an real-time OS,
they wouldn't do any better. A real-time OS is not a panacea.

> The Cyrix 486 is not a 16-bit CPU. Both bus and internally 32-bits.

There are a number of Cyrix 486 chips.

They are all 32-bit internal with cache, but some have a 16 bit
external databus.

486SLC - 16 bit databus.
486DLC - full 32 bit databus.
486DX/2 - full 32 bit databus (+internal FPU?)

The Cyrix 486s found in the Amiga bridgebaords are all SLC models.

The 16 bit databus will slow the machine a little. How much depends
on whether or not you are running 32 bit code. With DOS and Win-16 there
is v. little difference.

The Falcon however also only has a 16 bit databus connection. However
with the 68k series, ALL code is essentially 32 bit so I'd say that the
speed decrease from the Falcons CPU interface design will be more
critical than that experienced by a 486SLC design (for what its worth).

Sure, if you take the definition of efficiency from a textbook, where examples of MT are pulled from the aims of giant batch-bound mainframes.

I find I'm more efficient in my work if the computer reponds to *me*.

>machines just aren't fast enough. Even if they had an real-time OS,
>they wouldn't do any better. A real-time OS is not a panacea.

A panacea for what?

A user interface is, inherently, a realtime problem. The Amiga OS has several
features that make it suitable for such RT systems, making user interface
response on the machine very good indeed.

Pick up a few textbooks. Until you've reada them, pray daily that your
employer doesn't read your post. You just might lose your job.

What I am trying to say is: When cooperatively multitasking I cannot
be sure that the interactive processes get all the available CPU
cycles when they need to.

The interactive processes need to be able to preempt the
non-interactive processes. I fail to see how that could be done with
cooperative multitasking.

If I am wrong, please flame me.

ashdown@mpr.ca (Scott Ashdown) writes:

>>No, you don't NOTICE the slowdown. User interface response doesn't suffer.

>Isn't that what was said? "...without slowing down interactive tasks".

No, it's entirely different. It *does* slow down interactive tasks.
You, the human, just do not notice unless it is severe.

>Sure, if you take the definition of efficiency from a textbook, where examples
>of MT are pulled from the aims of giant batch-bound mainframes.

Or small computers that have a lot of work to do. Efficiency is basically
the ratio of time spent processing vs time spent switching context plus
OS overhead.

Also, few modern textbooks are going to be about batch processing
mainframes (which still do a great job on some tasks). It's been over 6
years since I programmed an IBM mainframe and while I have a little of
that in my head that isn't where I get my definition of efficiency.

>I find I'm more efficient in my work if the computer reponds to *me*.

Fine. It will also take longer overall. That is the tradeoff. If
the kernel is more responsive it's efficiency goes down. If you
increase efficiency, responsiveness goes down because the computer
is optimizing for overall throughput.

Systems like ITS had to deal with that. Did you make for better overall
throughput or did you make sure terminal users didn't see massive
time lag when they hit keys on their terminals?

For awhile, Linux archives had a modified scheduling algorithm for
heavy loads like news processing. But, the higher granularity made
the system less responsive. In the long run, the system was more
efficient and that was good for people who were running large programs
all the time, doing news processing every 15 minutes, etc.

>>Yeah, that's why they usually run on in interrupt. Easier to do than
>>polling them.

>No, not easier, but simply more efficient (your definition) to make it event
>driven.

I view event driven and interrupt driven as totally different. And yes,
it is easier and a lot of hardware won't support interrupts. Lot's of
systems have polled I/O ports (which, depending on the hardware, just

might be better... though rarely).

>Timers to *control* the drive? Rethink that.

Why? Pick up a hardware manual for programming floppy devices and
see for yourself. Not all systems do it that way, but many do.
Look in the source code for Linux where they have to program the
system timers in the floppy device driver code.

>>>The fractal generation is at the lowest priority. The other tasks are
>>>using constant amounts of cpu power, this one is eating all it can
>>>get. It should get only what is left over when the other tasks have
>>>taken their share.
>>
>>Sure... in a perfect and nonexistant world.

>In what way is a round-robin scheme w/priority nonexistant?

In that the fractal generation program will either eat a lot of CPU
or run very slowly. In a simple round-robin tasker with priority,
sure. But then it runs slowly. In that respect AmigaOS is a bit
like Minix. I prefer a system which dynamically alters priority
according to what is going on in the system. Of course, you can
change process priority in UNIX as root (or to a lower priority as
a user) but it's not the same.

>I'd like to see a discussion on a robust cooperative timeshare system,
>it'd be interesting. I doubt you'll be able to find one.

First of all you said robust and I didn't. Second, priority driven
time sharing systems may not have been robust but they existed and
they worked after a fashion.

And, I don't have to find one. I have only to open up a book about
one of them and read it.

>You've obviously taking a course in operating systems and have just had your
>first class on MT. May I suggest waiting until the end of the semester before
>deciding you know it all?

May I suggest that you take some classes? I've had mine years ago.

>>Bwahahahahahahahhahahahahaha! If it was then people wouldn't spend $$$$
>>on things like QNX and VxWorks. Do you make this crap up as you go along?

>The Amiga OS in many ways qualifies as a realtime OS.

So you are saying that AmigaOS will respond instantly to an I/O request,
immediately dropping any other task regardless of priority, and service
the I/O? Will it garantee microsecond context switching time? QNX
and VxWorks do.

>>>UNIX is not.
>>
>>Standard UNIX, no. But it doesn't keep it from doing what your Amiga does.

>>Given that I do it every day, day in and day out, year after year I'd
>>say you don't know much about UNIX...

>I find it hard to believe you know anything about realtime SW, so I doubt
>you use a UNIX variant as an RTOS.

I never said I used UNIX as a real-time OS. I said it can do what your
Amiga can with little trouble. Now, I do program real-time systems
under UNIX but that isn't what I was talking about above.

>>There are free real-time OS's that are far better than Amiga's OS for that
>>sort of thing.

>For what sort of thing? You've somehow been able to class all realtime
>systems together and give them a standard set of environmental requirements?
>Amazing.

OK, I'll give you that. I am not classifying all of them the same. But
I do mean to say that there are a number of freely available real-time
kernels that are much better suited to real-time data-aquistion, control,
logging, and embedded applications than AmigaOS.

>It would appear that you have even less.

>>Also, were I work we build real-time systems with plain-vanilla UNIX.
>>Only when we are unable to garantee real-time response to I/O are we
>>forced to use a real-time OS. Everything else is kept real-time by

>No offence, but without IO, there's no way you're dealing with a realtime
>system. The computer's not responding to anything that's "real".

Not true. A system can be responding in real time to a model or simulation
as well as I/O hardware. The same garantees of responce time and priority
exist, especially when the model is simulating the real hardware and the
user must not be able to tell which is which. We have the same software
talking to real hardware able to talk to a simulation and it doesn't
know the difference except that some flags are different (our user
interface has to know after all).

Real-time constraints on the UNIX side are quarter-second for data
analysis and tenths of a second for I/O. The I/O system is running
VxWorks and must respond truly real-time with little or no delay in
response. The I/O hardware does not buffer and a miss can be fatal.
Once in shared memory, the UNIX side has a bit of leeway though not
much. It's just that on that side nothing gets fried if the system
misses a beat now and then. It just makes a blip on the stripcharts
is all.

>>clever programming, multiple CPU's, and other tricks. Our software

>Oh, so you're an expert in parallel processing too, eh?

Never claimed to be an expert in anything. I just claimed that you
were wrong in your post and you were. Not totally, but you missed

quite a few.

No, we have no parallel processing systems. We run VME cages with Sparc or Motorolla CPU's alongside i860's sharing memory on the bus. That and the fact that our analysis, modeling, and GUI run on 3 different computers networked via ethernet is what I mean by multiple CPU's.

>>tracks it's cycles and responsiveness so we know if we cannot meet
>>real-time goals. At that point it's because some of our development
>>machines just aren't fast enough. Even if they had an real-time OS,
>>they wouldn't do any better. A real-time OS is not a panacea.

>A panacea for what?

I.E. it won't solve problems of not enough CPU power. If the time to handle a request is greater than the time between requests then it won't matter if you have a real time OS. You have to get more CPU power or write tighter code or both.

>A user interface is, inherently, a realtime problem.

No it isn't. If the OS doesn't respond to your mouse click in less than 15ms it won't cause anything to explode, burn, trash a simulation's data, or cause lights and switches to be missed. It can take all day if it wishes and nothing will be harmed. The user won't like it, but it's OK for it to happen. If the system is heavily loaded, it WILL happen.

> The Amiga OS has several
>features that make it suitable for such RT systems, making user interface
>response on the machine very good indeed.

Fast graphics hardware and a decent OS, not real time. My UNIX box has fast graphics, decent CPU, nice OS. Same effect, although better at handling a load. Not as small but that's OK with me.

I don't really think the Amiga would be a good platform unless you had source code and could get one on a nicer bus (like VME).

>Pick up a few textbooks.

Bite me. I've got all I need if not all I want.

>Until you've reada them, pray daily that your

3640. Volume of traffic in *.advocacy, and dying computers

Newsgroup: comp.sys.atari.advocacy
Date: 1994-09-02 15:05:13 UTC
From: ljw1004@cus.cam.ac.uk
Message-ID: <347ev9$13l@lyra.csx.cam.ac.uk>
Source record: 15688

It seems to me that the volume of traffic in a *.advocacy newsgroup is proportional to how soon that computer system will die out. The large number of postings is similar to the final flurry of panicked activity when ants rush about wildly under a magnifying class, or when politicians insist they have done nothing wrong just before a major scandal breaks out. It is, as it were, the final death-gasp, or the 'false recovery' just before a seriously ill patient dies.

I propose, therefore, to measure traffic in the *.advocacy groups and to divide by the total number of users of that system.

Perhaps the best way to affect the outcome would be to abandon your 'home turf', and take on in vicious onslaughts the heathens from other advocacy groups.

I shall post results.

(If anyone could point me to documents listing newsgroup propogagion & readership, or statistics listing computers sold or their market shares, I would be very grateful).

Well, it's been my experience that .advocacy activity grows as
speculation grows. Right now, with Chicago looming, Daytona nearing
release, Personal OS/2 in beta and also nearing release, and Enterprise
OS/2 not so far off (not to mention OS/2 for PowerPC and Taligent) it
would just seem that users have a lot to talk about.

Indeed, the best time to know when the end is coming is to look
for posts like "XXX is shit!" , "N is going to buy M!", "new N rumors!",
"N chipset about to come out!"
(no offense to Amiga users.. :))

I have been told by someone who works for IBM that when IBM designed the PC, they went to Intel and had them redesign the 8088 so that the jump-points for the IBM BIOS and add-on cards were hard-programmed into the microcode.

This has caused problems to no end when running operating systems that don't want the BIOS ROM in the way and the CPU doing screwy things because IBM forced Intel to design it a certain way.

No, I think spell-checkers are for witches and others who cast spells.
A hex calculator also comes in handy if you're into that kind of thing.

Well if one were to listen to G. Gordon Liddy's Radio program or (programme)
you would be told it was due to Outcome Based Education. :-) Still, even
the occupants of the Logres must agree that language is a 'living' rather than
fixed thing. Thus, one must expect changes over time. The problem lies in
the fact that given much improved technology the changes are far more rapid
than they were in the past. Expect 'ugly' versions of English to appear
in the not too distant future. Too bad French isn't the 'International'
language; I would enjoy spending time making hideous grammatical errors in
French on the Internet.

Don't think so. The 8088 was around before DOS. What I read in the
Gates biography was that IBM designed the motherboard to jump right
into DOS and that little was done to make it generic for other OS.
But I'm not clear on that.

Another thing, CP/M ran find on the PC as does Minix, Xinu, and a few
real-time operating systems.

>This has caused problems to no end when running operating systems that
>don't want the BIOS ROM in the way and the CPU doing screwy things
>because IBM forced Intel to design it a certain way.

If they don't want BIOS then they just don't use it. The only real problem
is that it takes up some available address space. Technically, you could
install a tiny ROM and remove most of it. That would keep BIOS from doing
something on powerup that you didn't want. There are many 8088/8086
systems that aren't PC's and have a different BIOS or none at all. There
are some PC's with the original BIOS removed and replaced with a different
one too.

I would venture to say that yours is not the "typical" OS/2 experience, or
there would not be so many OS/2 .advocates...

But seriously, my 386DX-25 (!) runs OS/2 just fine. I've had minor
problems, but never anything I would consider serious. I doubt any
platform's ability to achieve absolute perfection. There's likely
someone out there having problems with every type of computer/OS.

Only DOS apps I haven't been able to run under OS/2 are those few that
use VCPI instead of DPMI. You can't run those under Windows either, though,
AFAIK.

And yes, I will be upgrading that motherboard soon. :-|

>No, I'd take my amiga 3000 over a PC with OS/2 any day.

I can understand that, assuming your interests correspond with the Amiga's
strengths. I hope you can understand that because of my (different)
interests, I'd take my PC with OS/2 over an Amiga 3000 "any day."

> > You need to take a visit to the 1990's. There is FAR more that

> Sure, Amiga OS isn't perfect but I suits me better than all of the above.
> And my PC? It has linux installed, of course. A REAL OS!

So, linux is a "real" OS, and OS/2 is, then, I would assume, an
"artificial" OS? Problem is, OS/2 can run all of my "real" software,
including the many Windows apps for which there are, sadly, no
reasonable alternative (i.e., PageMaker). Meanwhile, it is my
understanding that through WINE, linux can run Taipei, sort of.

Linux is great to have in Boot Manager, to do unix-type stuff and
for netting, but to suggest that it is the be-all, end-all PC OS
is, I believe, specious.

I have a set of backup disks I made several years ago (using Turtle)
just prior to selling my STe. I ftp'ed MTool off the net, but it only
reads standard MS-DOS disks. Has someone hacked MTool, or has some
other piece of software that can be used to access TOS floppy disks
from a UNIX workstation?

Christopher

P.S. The specific workstation is a NeXTstation, however any sofware
which compiles on a BSD based UNIX should be OK.

Wow... Apple is now down to only about 2 times the price of an Intel
box with the same performance.

I can't wait till the PowerPC chip is available in a non-Apple machine
so we can finally see what it can do when not saddled with the
CrappleMacOS. I used to think the Motorolla '040 was garbage because
all the Crapples running one were so incredibly slow compared to my
abacus (graphics weren't as good either). Then I saw an '040 in a
decent motherboard with a VME-bus and a good operating system and it
really screamed. CrappleMacOS must eat a huge chunk of CPU time.

I realize that a Mac is easy to use for a beginning but why does it
have to keep you chained to the GUI? Somes things are still better
done on a text screen and why suck up all that CPU for graphics when
you don't need them?

Why, after 12 years, hasn't Crapple created a decent operating system?
It doesn't have to be a choice between easy and powerful. I would be
really ticked off buying one of the current Crapples where you pay
in excess of $3000 to get what I have on my desk and you still don't
have decent video speed, filesystem speed, or a good OS.

I'd have to disagree with ya...
Cubase and KCS are both really nice sequencers...loaded with features and punch...but C-Labs Notator is the my personal favorite...mainly because it doesn't glitch and barf during sequence play back just because you bumped the mouse. Notator/Creator can be multitasking three programs, sending a 64K sysex message, and playing a 200 track sequence all at once and not even skip a beat. KCS Omega hates Sysex and only multitasks with other Dr T. programs...many of which totaly stop your sequence from playing, or glitch when you activate them (actualy just clicking an option makes it glitch, let alone ask it to multitask). CueBase likes to skip beats when changing screens or clicking options as well. Notator is also the most flexible in editing and doing realtime manipulations of MIDI data. KCS is really awsome in this area, but very very hard to use and understand.
Oh well...that's my opinion and why.

Brian

>You, the human, just do not notice unless it is severe.

Okay, then you're just plain wrong. The UI was at a higher pri, therefore no slowdown.

>>Sure, if you take the definition of efficiency from a textbook, where
>>examples of MT are pulled from the aims of giant batch-bound mainframes.
>
>Or small computers that have a lot of work to do. Efficiency is basically
>the ratio of time spent processing vs time spent switching context plus
>OS overhead.

You might want to reread your original post. The "work" which you were talking about there amounted to number crunching, and you gave the UI a back seat.

>Also, few modern textbooks are going to be about batch processing
>mainframes (which still do a great job on some tasks). It's been over 6

Most modern texts include such discussions.

>years since I programmed an IBM mainframe and while I have a little of
>that in my head that isn't where I get my definition of efficiency.

Again, reread your orignal post. It took you well over a week to respond, so you've obviously forgotten what you wrote.

>>I find I'm more efficient in my work if the computer reponds to *me*.
>
>Fine. It will also take longer overall. That is the tradeoff. If

What will take longer overall? Pure number crunching? Sure it will - that's obvious. However, a user is likely to gauge a machine's efficiency by how quickly it responds - to *them*. Your definition is, shal we say, archaic.

>the kernel is more responsive it's efficiency goes down. If you

There's your efficiency bit again. I guess you didn't forget.

>increase efficiency, responsiveness goes down because the computer
>is optimizing for overall throughput.

Views like this are ancient! "Overall throughput" doesn't mean much to a user
who has to wait five seconds for a window to light up when he moves the
pointer over it.

>Systems like ITS had to deal with that. Did you make for better overall
>throughput or did you make sure terminal users didn't see massive

>all the time, doing news processing every 15 minutes, etc.

If you're trying to argue that we go back to the days when maximum CPU
utilization is king, it's a wasted effort. If you're arguing something else,
state the point. Examples with no focus aren't of much use.

>>>Yeah, that's why they usually run on in interrupt. Easier to do than
>>>polling them.
>
>>No, not easier, but simply more efficient (your definition) to make it event
>>driven.
>
>I view event driven and interrupt driven as totally different. And yes,

Why would you view them differently? There's absolutely no reason - they're
identical.

>it is easier and a lot of hardware won't support interrupts. Lot's of
>systems have polled I/O ports (which, depending on the hardware, just
>*might* be better... though rarely).

>Look in the source code for Linux where they have to program the
>system timers in the floppy device driver code.

I don't disagree that timers are used to interface to floppies. They do
not, however, *control* the drive.

>In that the fractal generation program will either eat a lot of CPU
>or run very slowly. In a simple round-robin tasker with priority,

Yes, it might well run very slowly. Neither myself nor the original poster
stated anything eother way. Indeed, the original poster mentioned that it
would get any left over CPU time, to which you replied 'Sure... in a perfect
and nonexistant world', which is totally incorrect.

>
>First of all you said robust and I didn't. Second, priority driven
>time sharing systems may not have been robust but they existed and
>they worked after a fashion.

Yes, they did. However, the comment was *cooperative* systems. Robustness
is completely topical when it comes to MT.

>the I/O? Will it garantee microsecond context switching time? QNX
>and VxWorks do.

Your IO example assumes a hard RT system. I never stated such compliance.
(Besides, interrupt response on the Amiga is quite good indeed.)

As for microsecond context switch times, that's seriously hardware dependent,
and is largely irrelevant for many RT systems (i.e. 1us and 60us both do just
fine in many cases).

>>>>UNIX is not.

Of course there are. But to suggest that the Amiga OS can't perform such
duties quite well (well enough that several labs use the machine for data
acquisition) is false.

>>>Also, were I work we build real-time systems with plain-vanilla UNIX.
>>>Only when we are unable to garantee real-time response to I/O are we
>>>forced to use a real-time OS. Everything else is kept real-time by

This is no longer real time. It's a simulation, hence the term "simulation".

>exist, especially when the model is simulating the real hardware and the
>user must not be able to tell which is which. We have the same software
>talking to real hardware able to talk to a simulation and it doesn't
>know the difference except that some flags are different (our user
>interface has to know after all).

Lots of people allow their RT SW to run with simulated inputs. Testing would
be pretty tough otherwise. However, if RT systems didn't have IO as a critical
component, you could just throttle the incoming data flow and eliminate most
RT concerns. Such systems become nothing more than number crunchers.

>>>clever programming, multiple CPU's, and other tricks. Our software

You have a very narrow view of RT systems.

>wishes and nothing will be harmed. The user won't like it, but it's
>OK for it to happen. If the system is heavily loaded, it WILL happen.

You don't think the event could get lost? Why do you think events are
buffered? Look at that - bits of RT design creeping in already.

A UI isn't your classical control-the-space-shuttle RT system, but research
in this area is heavily focused to user feedback. Once you decide that the
user *needs* feedback, the system becomes real time.

An example? Sure. The dialtone on your phone shows up within a bounded
time period - the UI is an RT system.

>> The Amiga OS has several
>>features that make it suitable for such RT systems, making user interface
>>response on the machine very good indeed.
>
>Fast graphics hardware and a decent OS, not real time. My UNIX box has
>fast graphics, decent CPU, nice OS. Same effect, although better at
>handling a load. Not as small but that's OK with me.

Better at handling the load for number-crunching, not for the OS, which is
why SPARC 10s can still be made to freak out and ignore the user for a long
time compared to the Amiga (and we're talking stock A2000 here).

As an aside, the Amiga's graphics are anything but fast.

>I don't really think the Amiga would be a good platform unless you
>had source code and could get one on a nicer bus (like VME).

VME? With the 64bit extensions that came in with (AFAIK) Revision D? The
whole system is far too slow, not being desinged with modern convienences
like controlled-slope drivers in mind. NewBridge uses VME for setup/takedown
of communications only, and employs FDDI on the front panel for actual data
transfer. Why would they have to do this if VME were the saviour?

Although it's definitely PC-directed, PCI is nicer in many ways, and if
there's ever another Amiga, it'll have PCI.

As for source, if you mean you like hacking the OS, there are few machines
that are as flexible as the Amiga.

Well, if she actually meant that slowdown was occuring but was so minor that the user didn't notice it, then she can't possibly under stand RR pri MT systems. I gave her the benefit of the doubt.

From: trauth@pepper.rutgers.edu
Message-ID: <34ire6$n0l@pepper.rutgers.edu>
Source record: 15717

Remember the "Sinclap Go Home" Survey that I conducted in May. I went home for Summer vacation before all the results were in, but at the time I left I had 3 yea's E-mailed to me and saw 5 yeas and 1 nay posted (8-1). I know no one can anything about E-mailed responses, but does anyone know how many yea's and nay's were posted. Any information on this would be greatly appreciated.

On another note, what is the current top-of-the-line Atari computer, what chip does it use, who big is its hard disk, and how much memory can be put into it? I am not planning on buying an Atari (my next computer will be a 486DX2/66) but I am just curious.

Thank you,

* Tom

PS: Has the LORD (Steve) ever reappeared here? This group isn't the same w/o him. He was like Sinclap, except with brains, manners, and a more subtle "Buy a Mac" campaign.

>good mouse?

I don't see how this is really relevant to atari, but . . .

$1300 is an attractive price on a PowerMac, but it is still possible to
beat that price with an Intel.

Add the numbers, you can get a low end (60MHz) Pentium for that price.
The Pentum has similar specint numbers to the PowerPC (the main advantage is
the cost of the chip). [The PowerPC 604 will blow doors on the Pentium, but
that is a little while away].

Here is my computation incase you doubt it:

Case + Fan $70, mouse $20, keyboard $40, floppy $80, 250MB HD $140,
4 MB memory $150, 44KHz sound card $60, video $80, motherboard $200,
60MHz Pentium $500.

Remember, the PowerMac 6100 has pretty poor video speed, so I did not include
a good video card. Sound cards are a dime a dozen.

We will see if Apple even drops the 6100 that low. Of course the Mac doesnt
come with a keyboard, so that gives a few bucks leeway on the other numbers,
but they are all reasonable.

For a more relevant question, how much IS a Falcon and a TT? How
about other atari computers? I have not looked at price is a long time.

Still the same. I wouldn't expect any new atari computers from atari for a
while, I'd give it about a year. Clones are coming out, so I'd venture that the
Medusa/Pandora can be considered the top of the line for now. It has a 64mhz
040 and you basically order the gfx and HD you want. It is expensive, though.

Will this new Atari coming out in a year have a RISC chip? It seems that everyone
outside the Microsoft/Intel Axis is going RISC nowadays. I even saw articles last
year c.s.amiga.adv that said that an Amiga based on the HP PA-RISC chip would
eventually come out (with "eventually" probably meaning the year 2000 or something).

>>PS: Has the LORD (Steve) ever reappeared here? This group isn't the same w/o

>Nope. I think he's still upset at me. :)

If that guy had one problem, it was his complete lack of a sense of humor. He took
everything that was posted WAYYYY too seriously! Oh well <sigh>. I guess he's one
of those guys who has no life outside of Usenet.

Speaking of guys that have no life outside of Usenet, what did Sinclap (Sinclair,
whatever...) do that was so attrocious as to motivate his system administrator to
deprive him of his livelihood. I did not read Usenet during the Summer (had better
thing to do) and missed the post(s) on rec.video.games.atari that supposedly got
him in trouble.

>that is a little while away].

The 60MHz pentium specs 10% faster for integer and 30% slower for floating
point performance. I would say the PPC beats it for pure SPEC and
remember that the 6100/60 has on optional L2 cache card that we are
not counting.

> Here is my computation incase you doubt it:

> Case + Fan $70, mouse $20, keyboard $40, floppy $80, 250MB HD $140,
> 4 MB memory $150, 44KHz sound card $60, video $80, motherboard $200,
> 60MHz Pentium $500.

You are buying a totally crappy mouse for the PC. The Apple mouse is sold
for $99. I don't know where you can get a 250Mb HD for $140 but if you
can that's a great deal! $1.78/Mb. The 6100 comes with 8Mb of RAM so you
will have to upgrade your pentium. Can you get a 16-bit 3 channel 44KHz
card for $60 without it using FM systhesis? Now all you need to add to
your pentium is a SCSI port, ethernet and a mic (44KHz stereo) and you
have $0 to do it with :)

> Remember, the PowerMac 6100 has pretty poor video speed, so I did not include
>a good video card. Sound cards are a dime a dozen.

I would think that the 6100 video is faster than a $80 video card. Are there
any $80 video cards with 1Mb VRAM?

> We will see if Apple even drops the 6100 that low. Of course the Mac doesnt
>come with a keyboard, so that gives a few bucks leeway on the other numbers,
>but they are all reasonable.

If you subtract the keyboard cost from the PC you get $1300 exactly so you
don't get any leeway.

Because he keeps getting kicked off for being about as clueless as one can get.
(oh he will TELL you that the first time was because the moved his account from
one system to another and was not allowed to keep the same user id. Yeah right :)

The reason he does not have to change it more often is that most people use
kill files, and it takes those that don't a while to get pissed off enough
to complain to the postmaster.

>Say, I'd love to know where I can ger a 250mb IBM hard drive for $140!!
>Perhaps you can let us in on who your distributer/manufacturer is ?

I could send you a catalog if you mail me your address.

This is not such an amazing deal.. It is a little hard to find low
density drives for cheap because of manufacturing costs, but it is possible.

In fact $140 for 1 250mb IDE hard drive is not very good from a $ per
Mb value. (I.e. it is more than $.50 a MB).

2.1 gb (formatted) drives can be found for $600 to $700.

But anyhow, if you really want a 250mb drive for $140 I can mail you a
catalog. There are at least two stores near here than can do that sort of
price.

: that is a little while away].

The problem is that the MacOS is so doggone slow. Slow graphics on
most Mac's don't help much either. That's one reason I wish Apple
and Atari and all of them would do like PC's and always have a standard
expansion bus so you can upgrade later. Standard cases that can take
new motherboards would be great too.

There is no reason at all why an Atari built in 1986 should not still
be running with the latest Atari motherboard. They had only to create
a standard crate and stick with it.

: We will see if Apple even drops the 6100 that low. Of course the Mac doesnt
: come with a keyboard, so that gives a few bucks leeway on the other numbers,
: but they are all reasonable.

I wonder why no one has created a way to plug standard PC keyboards into
a Mac? They are so much cheaper.

: For a more relevant question, how much IS a Falcon and a TT? How
: about other atari computers? I have not looked at price is a long time.

I ordered a Toad catalog two weeks ago but it's not arrived yet or I'd
say. Last time I checked some of them were decently priced while others
were a bit on the high side.

10. Complain to his system administrator.
9. Force him to watch the destruction of 100 PowerMacs.
8. Disgrace him by posting his picture all over the Net.
7. Force him to buy an Atari ST.
6. Make him trade in his beloved Game Boy for a Jaguar.
5. Put a virus in his Mac that flashes "ATARI RULES"
every time he boots it.
4. Tie his ankle to box containing 25 PowerMacs and throw
it off a cliff.
3. Resurrect Commodore.
2. Make the Atari Lynx the #1 computer in the world.

And (drums please) ...

The #1 way to kill Sinclap is to banish him forever from
Usenet, which would deprive him of the only thing
he lives for and thus force him to commit suicide!

(Applause please)

Now what are the prices for an assembled/tested system from a major
manufacturer? If your going to do a comparison, do it fairly. Like it
or not, the PPCs will be getting very price competetive, and price
competition is a good thing for all of us.

Brian,
You mean that you LIKE the Mac mouse?! Ugh! If it is a $99 item
than there is a problem. My friend hated the new Mac mouse because
if you press the button down too hard to drag it usually causes mouse
movements to be very difficult. This wasn't a desgn problem; he just
shouldn't press down so hard, right? :-). Another thing I hate about
the Mac is the keyboard. For all the complaints about the ST/Falcon
keyboard they are so much nicer than the Mac's.
Back to the mouse: try out a Golden Image mouse: $60. Much nicer
than the Mac mouse.

See above. Dream on!

: ========================
: = Jani Miettinen =
: = t93074@mail.vitech.fi =
: ========================

Well, I myself am sitting here at a SparcStation 10 with quite a lot more
CPU-Power, than any Amiga will perhaps ever have (nearly 100 Mips) - and
I'm still sometimes annoyed, because I have to wait for some tasks. But

maybe it's only because I use it in a large Multiuser-Networked-Environment
with lot's of Power-hungry users and a GUI, that allows me to run a programm
on a Supercomputer and have it's graphical output onto *MY* screen !?

Believe a grown-up, who has left these nice toy computers, you are talking
about, some years ago, that the slowdown on any machine is depending on:

- how many tasks you try to run at the same time
- how much real CPU-time is needed for that program
(What does your Amiga, if you start 10 times the fractal
program ? - Do you have any chance to start any other program,
then? Try starting a C-compiler at the same time - have fun!)
- the amount of memory you have
- how fast your harddisk is (important for swapping...)
- how your operating performs the taskswitches and
copes with your resources
- how many CPUs and/or special I/O-processors your machine has

Well, i don't believe that this list is complete, but it covers some of the
most important things.

I started my computer carreer with a 300 baud acoustic coupler logged into
a host system at a university with more than 20 people standing around me,
while i was hacking into some kind of teletyper (some kind of a printer
with a keyboard added :-). - I know, i know - That's quite sophisticated
technology. I know some people which had to wire their programs into magnetic
rings... :-) - But that's the way i started.

Later I bought myself an ATARI 800 XL which I was very fond of, because it
was much better than that !@$#-C64, and much cheaper than the Apple][
which my friend had.

Later i was interested in some faster hardware, so i asked around which
computer has the best architecture, processor, basic software (not the
language!) and operating system.

I had the choice between a 286, a Mac, an Atari ST and an AMIGA.
- I chosed the ST. - And: I still love it.

But later i needed much more power and i got in touch with real multitasking
systems. So I first tried to speed up my ST. But it was of not much use.
There was for a long time no multitasking OS available, and the sheer need
of power for those really mighty systems forced me to buy an Intel-based
System. (I still hate this dang thing! - But there's no cheap alternative
for a power-hungry...)

I do use my 486-40 MHz under DOS only for the nice Games, they have. And
if i have some real work to do - I boot Linux !!!!
It's quite nice for me, because in the meantime i have an old Sun 3/60
so i can use them with NFS, X11, and so on. I can share each others
hardware and have still one of my beloved 680x0-CPU's with an OS for
grown-ups...

By the way: If you don't have a grown-up OS like SunOS 4.1.3 and have some trouble with a BUG, what do you do on your Amiga ? - Gee - You can *wait* ! - And hope for someone who may sometimes run into the same bug. And then you have to wait for some thousends more, and then you can get a new Version of your OS - The bug still won't be fixed...

So I really love Linux, because if you have a problem there, it's up to your's to fix it!!! - Just only having the possibility to do that gives me a *very* good feeling.

So, dear Jani, please don't feel too much offended, when I suppose you now:

Flame on:

Go and get yourself a *real* computer, with a *real* operating System, and keep your baby-talk about your *dream-machine* (AMIGA) for yourself.
It's too obvious that you don't have any real expierience with computers at all.

Flame off!

Best wishes,

Herbert

>not counting.

Yeah, the Pentium uses an external cache as well. Generally 256K, 512K, or
1MB (1MB is very costly. 256K is basically free on the motherboard). I would
expect pretty similar performace. I am not an Intel fan, and their
architecture is likely to slow down real life performance. But the PPC is
probably not being used as well as it should be in the Mac OS.

>> Here is my computation incase you doubt it:
>
>> Case + Fan $70, mouse $20, keyboard $40, floppy $80, 250MB HD $140,
>> 4 MB memory $150, 44KHz sound card $60, video $80, motherboard $200,
>> 60MHz Pentium $500.
>
>You are buying a totally crappy mouse for the PC. The Apple mouse is sold
>for $99. I don't know where you can get a 250Mb HD for $140 but if you
>can that's a great deal! $1.78/Mb. The 6100 comes with 8Mb of RAM so you
>will have to upgrade your pentium. Can you get a 16-bit 3 channel 44KHz
>card for $60 without it using FM systhesis? Now all you need to add to
>your pentium is a SCSI port, ethernet and a mic (44KHz stereo) and you
>have $0 to do it with :)

The SCSI port is not really needed for a PC. It is a luxury. You can get
a Microsoft mouse in a plain box for like $45. That is a decent quality
mouse. True a $20 mouse probably sucks pretty badly. The HD price is
possible, but deffinately a good deal. (IDE is much cheaper than SCSI for
small drivers. For > 2 GB the price difference is much less). As far as
sound, the Pro Audio Spectrum offers 4 channel 44KHz 16 bit sound. I
honestly do not know if this is using FM synthesis. (Well, the card does use
FM synthesis, but it might also have other capabilities - I dont know).
(I have not been impressed with any IBM sound card simply because they have
a tendancy to have some static and discontinuous sounds. But ignoring that

fact, they do have good sound quality.) [Also you get MIDI thrown in the deal. That would probably add a few bucks to the cost of the Mac]

>> Remember, the PowerMac 6100 has pretty poor video speed, so I did not include
>>a good video card. Sound cards are a dime a dozen.
>
>I would think that the 6100 video is faster than a $80 video card. Are there
>any $80 video cards with 1Mb VRAM?

I think you could get older 1 MB VRAM cards for that price. Maybe an Orchid Pro Designer II or somenthing like that.

>> We will see if Apple even drops the 6100 that low. Of course the Mac doesnt
>>come with a keyboard, so that gives a few bucks leeway on the other numbers,
>>but they are all reasonable.
>
>If you subtract the keyboard cost from the PC you get $1300 exactly so you
>don't get any leeway.

Yeah, all in all $1300 is really not possible for a Pentium system. You could do it, but it would be very stripped down and have several low quality components.

I like Macs better anyhow :-)

But I don't think I would even consider a 6100 for my self. I just don't like the machine. It does not offer much expandibility, and has some other less than attractive features. I would put my bottom line at a 7100.

Apple has a real bad tendancy to rip you off for the middle and high end of their product line. The bottom line has been driven down to compete with the PC world.

For example, if you want the Mini-tower for your Mac (which I think is reasonable) and at least 3 expansions slots, you get heavily raped. You pay a BIG premium for the damn case and a few extras.

Enough blabbing!

- mike

also... why I hate macs:

I can outproduce anyone with an out-of-the-box unix box compared to an out-of-the-box mac. I prefer CLIs.

you can't have windows "follow" the mouse. you are forced to use click-to-type (which is really annoying).

you can't do rediculously simple things in parallel even with the advance multiprocessing (hahaha) of system 7.... things like when you copy a file, you're totally locked up until the copy finishes.

now for the little thigs:

apple's prices are insane

apple support is the pits

sys7 requires insane amounts of memory and mac/apple memory is not cheap.

sys7's memory management is broken.

you can't make those f'n pop-up-windows appear anywhere else than their default location

macs crash with unintelligible and cryptic error messages.

init conflicts (install one program and it kills 3 previously installed ones)

the insanity of programs not seeing or opening a data file just because the maker/type isn't what the application wants 9even though the data in the file *IS* correct).

I'll stop there, but the list is quite long.

Scott

G> on the legitimate users of that service though.

this is wrong. advocacy is a perfect group for sinclair. I think he
ahs a right to post here ... or at least he should have a chance to
post his opinion here.

lies, libelous posts should lead to a law suit...

It's one thing for him not to like Atari and atari products. It's
another thing to make up information and post articles with lies and
claim they are fact.

now, mailbombing. that' wrong.

first, it's the wrong way to do it.... if you want to be that way,
mailbombing is a good way to get your access cut. Finally, the
internet is not a battlefield. Believe me, the effects of using the
net to pound on a site or sub-network is quite devastating...

>copy a file, you're totally locked up until the copy finishes.

First of all, System 7 is multiTASKing. Apple makes no claims that System 7
is multiPROCESSing. Second of all, the problem with copying is fixed in
System 7.5, which is available now.

>now for the little thigs:
>
>apple's prices are insane
>
>apple support is the pits
>

System 7 can run comfortably (ie, with a few medium-to-large sized apps)
in 5Mb.

>sys7's memory management is broken.

I will grant you that it could be better.

>you can't make those f'n pop-up-windows appear anywhere else than

>
>macs crash with unintelligible and cryptic error messages.

Like Ataris and Unix boxes don't? (Can you say "TOS Error #35?")

>init conflicts (install one program and it kills 3 previously
>installed ones)

First of all, extensions are caused by badly programmed extensions. Second
of all, when I had my Atari I had constant conflicts with AUTO folder programs,
whereas I have had almost none on my Mac.

>the insanity of programs not seeing or opening a data file just
>because the maker/type isn't what the application wants 9even though
>the data in the file *IS* correct).

Programs which work with files which tend to be typed improperly (eg, JPEG
graphics, or sound files which both tend to be downloaded from DOS machines.)
usually allow ANY file to be opened, and will automatically fix the type for
you. JPEGView, Sound-Trecker, and Brian's Sound Tool are examples.
In addition, Macintosh Easy Open, which is a part of System 7.5 (available
now) fixes this.

I'd like to see you produce a three page layout using a CLI faster than
I can do it with my mac. What are going to do, write it in Post Script?

>you can't do rediculously simple things in parallel even with the
>advance multiprocessing (hahaha) of system 7.... things like when you
>copy a file, you're totally locked up until the copy finishes.

That was never true in system 7. You could always to something in another
application and system 7.5 allows you to still use other finder functions.

>apple's prices are insane

The 6100/60 is very competitive with the 66MHz pentium.

>sys7 requires insane amounts of memory and mac/apple memory is not
>cheap.

If you are using a quadra or a PPC mac then you use standard 72-pin SIMS.
The same ones that your PC uses.

>macs crash with unintelligible and cryptic error messages.

So does DOS, TOS, Windows and UNIX.

>init conflicts (install one program and it kills 3 previously
>installed ones)

That applies only to INITs and not applications. BTW, I've never had
an INIT conflict.

>the insanity of programs not seeing or opening a data file just
>because the maker/type isn't what the application wants 9even though
>the data in the file *IS* correct).

Most programs will open a file of any time.

Dave,
Tos Error #35 is trying to run a non-program with a program
extension. Not too hard to remember.
Also, how can you blame Auto program conflicts on the Atari?
Programs conflict. I certainly do not blame the Mac hardware
for the inability to use Photoshop and RAM Doubler together
for instance.
I am still interested.... what is the most recent version of
TOS you've used? I think the number is below 3.... Want
to compare System 6 to TOS 4.04?
Finally, this is not a flame.... are there any good alternative
OSs for the Mac like Neodesk for the Atari?

: See above. Dream on!

: : ========================
: : = Jani Miettinen =
: : = t93074@mail.vitech.fi =
: : ========================

: Well, I myself am sitting here at a SparcStation 10 with quite a lot more
: CPU-Power, than any Amiga will perhaps ever have (nearly 100 Mips) - and

: I'm still sometimes annoyed, because I have to wait for some tasks. But
: maybe it's only because I use it in a large Multiuser-Networked-Environment
: with lot's of Power-hungry users and a GUI, that allows me to run a programm
: on a Supercomputer and have it's graphical output onto *MY* screen !?

Nearly 100 MIPS? the Motorola 68060 60Mhz has 100MIPS today! The chip is
made and it it out. RCS already has a board developed for the Amiga
owners of RCS 68040 boards can upgrade right now.... 100 MIPS....

: Believe a grown-up, who has left these nice toy computers, you are talking
: about, some years ago, that the slowdown on any machine is depending on:

: - how many tasks you try to run at the same time
: - how much real CPU-time is needed for that program
: (What does your Amiga, if you start 10 times the fractal
: program ? - Do you have any chance to start any other program,
: then? Try starting a C-compiler at the same time - have fun!)
: - the amount of memory you have
: - how fast your harddisk is (important for swapping...)
: - how your operating performs the taskswitches and
: copes with your resources
: - how many CPUs and/or special I/O-processors your machine has

: Well, i don't believe that this list is complete, but it covers some of the
: most important things.

: I started my computer carreer with a 300 baud acoustic coupler logged into
: a host system at a university with more than 20 people standing around me,
: while i was hacking into some kind of teletyper (some kind of a printer
: with a keyboard added :-). - I know, i know - That's quite sophisticated
: technology. I know some people which had to wire their programs into magnetic
: rings... :-) - But that's the way i started.

: Later I bought myself an ATARI 800 XL which I was very fond of, because it
: was much better than that !@$#-C64, and much cheaper than the Apple][
: which my friend had.

: Later i was interested in some faster hardware, so i asked around which
: computer has the best architecture, processor, basic software (not the
: language!) and operating system.

: I had the choice between a 286, a Mac, an Atari ST and an AMIGA.
: - I chosed the ST. - And: I still love it.

: But later i needed much more power and i got in touch with real multitasking
: systems. So I first tried to speed up my ST. But it was of not much use.
: There was for a long time no multitasking OS available, and the sheer need
: of power for those really mighty systems forced me to buy an Intel-based
: System. (I still hate this dang thing! - But there's no cheap alternative
: for a power-hungry...)

: I do use my 486-40 MHz under DOS only for the nice Games, they have. And
: if i have some real work to do - I boot Linux !!!!

: It's quite nice for me, because in the meantime i have an old Sun 3/60
: so i can use them with NFS, X11, and so on. I can share each others
: hardware and have still one of my beloved 680x0-CPU's with an OS for
: grown-ups...

: By the way: If you don't have a grown-up OS like SunOS 4.1.3 and have some
: trouble with a BUG, what do you do on your Amiga ? - Gee - You can *wait* !
: - And hope for someone who may sometimes run into the same bug. And then
: you have to wait for some thousends more, and then you can get a new Version
: of your OS - The bug still won't be fixed...

: So I really love Linux, because if you have a problem there, it's up to your's
: to fix it!!! - Just only having the possibility to do that gives me a *very*
: good feeling.

: So, dear Jani, please don't feel too much offended, when I suppose you now:

: *Flame on:*

: Go and get yourself a *real* computer, with a *real* operating
: System, and keep your baby-talk about your *dream-machine* (AMIGA)
: for yourself.
: It's too obvious that you don't have any real expierience with
: computers at all.

: *Flame off!*

: Best wishes,

: Herbert

: : ========================

: Well, I myself am sitting here at a SparcStation 10 with quite a lot more
: CPU-Power, than any Amiga will perhaps ever have (nearly 100 Mips) - and

: I'm still sometimes annoyed, because I have to wait for some tasks. But
: maybe it's only because I use it in a large Multiuser-Networked-Environment
: with lot's of Power-hungry users and a GUI, that allows me to run a programm
: on a Supercomputer and have it's graphical output onto *MY* screen !?

: Believe a grown-up, who has left these nice toy computers, you are talking
: about, some years ago, that the slowdown on any machine is depending on:

: - how many tasks you try to run at the same time
: - how much real CPU-time is needed for that program
: (What does your Amiga, if you start 10 times the fractal
: program ? - Do you have any chance to start any other program,
: then? Try starting a C-compiler at the same time - have fun!)
: - the amount of memory you have
: - how fast your harddisk is (important for swapping...)
: - how your operating performs the taskswitches and
: copes with your resources
: - how many CPUs and/or special I/O-processors your machine has

: Well, i don't believe that this list is complete, but it covers some of the
: most important things.

: I started my computer carreer with a 300 baud acoustic coupler logged into
: a host system at a university with more than 20 people standing around me,
: while i was hacking into some kind of teletyper (some kind of a printer
: with a keyboard added :-). - I know, i know - That's quite sophisticated
: technology. I know some people which had to wire their programs into magnetic
: rings... :-) - But that's the way i started.

: Later I bought myself an ATARI 800 XL which I was very fond of, because it
: was much better than that !@$#-C64, and much cheaper than the Apple][
: which my friend had.

: Later i was interested in some faster hardware, so i asked around which
: computer has the best architecture, processor, basic software (not the
: language!) and operating system.

: I had the choice between a 286, a Mac, an Atari ST and an AMIGA.
: - I chosed the ST. - And: I still love it.

: But later i needed much more power and i got in touch with real multitasking
: systems. So I first tried to speed up my ST. But it was of not much use.
: There was for a long time no multitasking OS available, and the sheer need
: of power for those really mighty systems forced me to buy an Intel-based
: System. (I still hate this dang thing! - But there's no cheap alternative
: for a power-hungry...)

: I do use my 486-40 MHz under DOS only for the nice Games, they have. And
: if i have some real work to do - I boot Linux !!!!
: It's quite nice for me, because in the meantime i have an old Sun 3/60
: so i can use them with NFS, X11, and so on. I can share each others
: hardware and have still one of my beloved 680x0-CPU's with an OS for
: grown-ups...

: By the way: If you don't have a grown-up OS like SunOS 4.1.3 and have some
: trouble with a BUG, what do you do on your Amiga ? - Gee - You can *wait* !
: - And hope for someone who may sometimes run into the same bug. And then
: you have to wait for some thousends more, and then you can get a new Version
: of your OS - The bug still won't be fixed...

: So I really love Linux, because if you have a problem there, it's up to your's
: to fix it!!! - Just only having the possibility to do that gives me a *very*
: good feeling.

Linux is available for the Amiga so what's your point?

: So, dear Jani, please don't feel too much offended, when I suppose you now:

: *Flame on:*

: Go and get yourself a *real* computer, with a *real* operating
: System, and keep your baby-talk about your *dream-machine* (AMIGA)
: for yourself.
: It's too obvious that you don't have any real expierience with
: computers at all.

: *Flame off!*

: Best wishes,

: Herbert

I see... "Easy to remember" for the Atari, but "Cryptic" when the Mac does it.
Can you say "Double standard?" I knew you could!

>Also, how can you blame Auto program conflicts on the Atari?
>Programs conflict. I certainly do not blame the Mac hardware
>for the inability to use Photoshop and RAM Doubler together
>for instance.

The person who wrote the article to which I replied seemed to.

>I am still interested.... what is the most recent version of
>TOS you've used? I think the number is below 3.... Want
>to compare System 6 to TOS 4.04?

The last version I used was the last TT TOS -- 3.06, I believe it was.
I have played with TOS 4.x, but did not use it extensively. From what I could
see, most of the changes were cosmetic (icons, 3-D windows and dialogues, etc.)
It still only single-tasks -- unless you load MultiTOS -- and IMHO doesn't
compare to System 6.

>Finally, this is not a flame.... are there any good alternative
>OSs for the Mac like Neodesk for the Atari?

NeoDesk is not an operating system. There are programs that replace the
Finder -- At Ease is an example.

>IYHO.

Then a Mac will automatically rotate a window to the top when the pointer
moves into it? I really don't know, none of the ones I've seen do it
but mayber there is some 3rd party program or obscure keystroke to
do that.

>First of all, System 7 is multiTASKing.

COOPERATIVE multitasking. Horrible, inefficient, slow, and buggy.

>Apple makes no claims that System 7
>is multiPROCESSing. Second of all, the problem with copying is fixed in
>System 7.5, which is available now.

If the OS was any good you would not need fixes like this. What else
did Apple kludge/screwup/slow down to make the floppies work fast in
the background?

>System 7 can run comfortably (ie, with a few medium-to-large sized apps)
>in 5Mb.

You must be kidding. The average app uses 1-2 megs each. 5mb is not
enough for System 7 unless you stick with one app or a few small ones
or put up with it's jumpy, buggy virtual memory option.

>>macs crash with unintelligible and cryptic error messages.

>Like Ataris and Unix boxes don't? (Can you say "TOS Error #35?")

First of all, it's extremely rare that a decent UNIX box every crashes.
When it does, 99% of the time you get detailed information in your log
files telling you exactly why it crashed. We are talking about a
mainframe class operating system here and it makes sure you can diagnose
problems and most of the time you simply do not have them.

All the more amazing when you consider how scalable UNIX is... everything
from micros to multi-million dollar super computer systems.

>First of all, extensions are caused by badly programmed extensions. Second
>of all, when I had my Atari I had constant conflicts with AUTO folder programs,
>whereas I have had almost none on my Mac.

That's true. But then Atari is a CP/M machine and that is a very old
microcomputer OS. Newer versions don't have those problems as much
but I do not like the auto folder junk (nor the file system and a
few other things).

>Programs which work with files which tend to be typed improperly (eg, JPEG

>you. JPEGView, Sound-Trecker, and Brian's Sound Tool are examples.
>In addition, Macintosh Easy Open, which is a part of System 7.5 (available
>now) fixes this.

yeah, automatically screw the file up you mean. Almost without fail,
any time I get a graphic file that is trashed I look at it with a binary
editor and sure enough, it was from a Macintosh. That "fixing" doesn't
fix much. It changes them to something not standard jpeg. For one
thing, a lot of information is added before the header sometimes.
It's possible that this is because the Apple user screwed up when uploading
the file and sent something besides the data fork. Usually I just delete
the first X bytes from the file and create a valid jpeg/gif/blah header
and I can then read it. I guess someone needs to write a viewer that
will recognized a file that's come from a Mac and been "fixed".

>I'd like to see you produce a three page layout using a CLI faster than
>I can do it with my mac. What are going to do, write it in Post Script?

Pretty easy of you are good with TeX. I can take a 500 page document
that is formatted for three columns with graphics and the works and
by changing a single line in the TeX source, change it to be two columns
with completely correct spacing, graphics, flow, and all that. Such
a feat would take hours on most dtp packages for any platform. They
really slow down as the document size increases.

I tried doing a newsletter with dtp and TeX. Once I learned TeX I
found I could create, layout, and produce the newsletter far faster
than with the dtp program. It was easier initially with dtp but
after awhile I came to appreciate having the computer do the layout
for me.

>That was never true in system 7. You could always to something in another
>application and system 7.5 allows you to still use other finder functions.

>>apple's prices are insane

>The 6100/60 is very competitive with the 66MHz pentium.

But the Pentium has faster graphics most of the time and I'm not
altogether convinced of the 6100's speed after having used some
yesterday. Plus, I'd have to run MacOS on it... ick! I'd love to
have a PowerPC with UNIX on it though... incredible machine to waste
on System 7.

>If you are using a quadra or a PPC mac then you use standard 72-pin SIMS.
>The same ones that your PC uses.

True. I wish the prices for memory would fall again like they used
to be.

>So does DOS, TOS, Windows and UNIX.

True, true, true, false. UNIX provides detailed information in the
extremely rare event that it crashes. The vast majority of UNIX
systems just don't crash.

>That applies only to INITs and not applications. BTW, I've never had
>an INIT conflict.

Also applies to rabid CDEVs and plenty of Mac applications will hose
the whole system because their is no memory protection to speak of.

>Most programs will open a file of any time.

So will UNIX... I just changed a file's date to July 1, 1972 and it
opened... imagine that! :-)

FOR SALE:

Atari 1040STF: Comes with built in Ports for Monitor, Printer, Modem, Hard Drive, External 3.5" Floppy Port, MIDI In and Out Ports, Cartridge Port plus Mouse and Joystick Ports. 1040STF has built in 3.5" Double Sided/Double Density 720K Floppy Drive. Built in drive reads 720K IBM disks. Computer has 10 Special Function Keys. Built in Numeric KeyPad. 94 Key Keyboard. Standard 1 MegaByte of Memory (RAM). Power Supply built-in, comes with Power Cable. Also comes with 2 Button Mouse for interfacing with GEM, (Graphics Enviromental Manager).

1040STF Computer Sells for $125!

Atari SC1224: Color Monitor has LED Power light on front. Has 3 Knobs on side: Brightness, Contrast and On/Volume Knob. Has Monitor Cable with 13 Pin Male Plug. Power Supply Built-in. Comes with Power Cable. Has 5 Video fine tune adjustments in back: V. Lin, V. Size, V. Hold, H. Position and H. Hold. Does both 40x25 and 80x25 Text. Does 320x200x16 Colors and 640x200x4 Colors. Does both InterLaced and NonInterLaced Graphics. Does both 50HZ and 60HZ refresh rate. Works great with Atari ST's, including 1040STF's.

SC1224 Color Monitor Sells for $125!

Your Choice, either the 1040STF or the SC1224 for $125!

>That's simply true.

No it isn't, if the tasks aren't busylooping. I have usually only 5% of
CPU time used on my A4000 even if I have about 30 tasks running.. Those
tasks WON'T slow down if I add a task that uses for example 50% of CPU..

>: add tasks. Tasks might get little less CPU time than before when new tasks
>: were launched, but CPU won't slow down. :)
>Amiga has - umh, ohh let's see... about 12 MIPS ?) when they could simply buy
>that great AMIGA, which never, ever will slow down ? :-) ROTFL !

My Amiga has only 20 MIPS now, but I've already ordered my Warp Engine
accelerator.

Jani meant that the _CPU_ doesn't slow down even if the tasks and OS does..
Or does your sparc switch to 10MIPS-mode when it detects that there are
over 50 tasks running, or something like that?

>Well, I myself am sitting here at a SparcStation 10 with quite a lot more
>CPU-Power, than any Amiga will perhaps ever have (nearly 100 Mips) - and

Hmm.. Sparc is RISC, so one shouldn't really compare MIPS.. But anyway
a 060 can do about 90 MIPS. And they are Motorola-MIPS, not Intel.. :)

>Believe a grown-up, who has left these nice toy computers, you are talking
>about, some years ago, that the slowdown on any machine is depending on:
> - how many tasks you try to run at the same time

Not really. Most tasks are just waiting for some event, like a key-press..
They won't take any CPU time, except under Windows. :)

> - how much real CPU-time is needed for that program
> (What does your Amiga, if you start 10 times the fractal
> program ? - Do you have any chance to start any other program,
> then? Try starting a C-compiler at the same time - have fun!)

Hmm. 10 fractal programs won't slow the C-compiler down AT ALL if the
fractal programs have lower priority. It seems that you haven't got
much experience of pre-emptive multitasking..

> - the amount of memory you have
> - how fast your harddisk is (important for swapping...)

True.

> - how your operating performs the taskswitches and
> copes with your resources
> - how many CPUs and/or special I/O-processors your machine has

True, but Amiga is much stronger in these aspects than many other machines..

>I had the choice between a 286, a Mac, an Atari ST and an AMIGA.

Hey, I never said that Mac error messeges were cryptic, Dave.
But you turning around and saying "like Error #35, right" was
silly. What other cryptic messages do you get on the Atari?
#35 is the most common and easy to remember. That was my point.
I'd say that TOS 4.04 is far superior to System 6 and as good
as System 7 from an average user's viewpoint (meant that I don't
need networking, etc.). It is faster than System 7 and allows
drag 'n' drop, assigning menu commands to any key, launching
applications with a function key, etc. I haven't seen anything
on the Mac that makes me want to switch OSs. Also, MultiTOS
is not the only solution for multitasking. Why not use Geneva
for cooperative multitasking or Magix for pre-emptive?
And, yes, sorry, Neodesk is a alternative desktop, not OS. Sorry
for the confusion. So, what does At Ease do for the Mac?

>But you turning around and saying "like Error #35, right" was
>silly. What other cryptic messages do you get on the Atari?

I didn't claim that you said Mac error messages were more cryptic. The
poster who started this thread did. TOS Error 35 doesn't bug me so much as
the way the bomb icons flash on the screen so briefly when a major error
occurs -- it goes by too fast for anyone to see how many bombs there are,
and thus to determine which error has occurred.

>#35 is the most common and easy to remember. That was my point.
>I'd say that TOS 4.04 is far superior to System 6 and as good
>as System 7 from an average user's viewpoint (meant that I don't
>need networking, etc.).

I have to disagree that System 7 and TOS 4.04 are just as good from an
average user's viewpoint. Even if you don't take into account multitasking,
System 7 offers features such as balloon help, aliases, transparent filetypes,
a universal font/printing system, descriptive filenames, and much more.
System 7.5 has Apple Guide, an *VERY* nice help system which actually shows
you on-screen what to do. TOS does not have any of these -- and desktop icons
are not as powerful as aliases; I've been through that argument before.

> It is faster than System 7 and allows
>drag 'n' drop, assigning menu commands to any key, launching
>applications with a function key, etc.

If you compare only base systems -- i.e, no third-party AUTO programs or
extensions, System 7 is faster. Even if you add programs, System 7 still
comes ahead, IMHO. System 7.1 runs at an acceptable speed, and System 7.5
has been speeded up significantly.

TOS drag and drop is not as powerful as Mac drag and drop, and there are many
programs which do not support it. I will grant you that the Finder, to my
knowledge, does not allow you to assign menu commands to any key or launch
applications with a function key, but I believe those functions can be
obtained by adding shareware utilities. These types of things are minor
compared to features such as descriptive filenames and a universal font/
printing system, that third-party software on the Atari has not or cannot
add.

> I haven't seen anything
>on the Mac that makes me want to switch OSs. Also, MultiTOS
>is not the only solution for multitasking. Why not use Geneva

>for cooperative multitasking or Magix for pre-emptive?

That's a matter of opinion. I saw a lot on the Mac that made me want to switch. I was tired of not only the lack of software, but also the lack of support for simple features such as a universal font system and a universal clipboard.

>And, yes, sorry, Neodesk is a alternative desktop, not OS. Sorry
>for the confusion. So, what does At Ease do for the Mac?

At Ease is a simplified desktop for new users. Square One puts up a pallete of icons and lets you launch programs and manipulate files. SpeedyFinder speeds up the Finder. Greg's Browser lets you manipulate files and run programs using something similar to the NeXT Browser. There are many others that I've probably forgotten.

Unlike the Desktop replacements for the Atari, they all try to do something different (eg, pallete of icons, a file browser) than the Finder. By contrast, the Atari Desktop replacements all use the same desktop metaphor as the Atari Desktop -- they just try to "get it right," so to speak, by adding features Atari missed.

Two years ago, one of my friends would always send me twenty copies of the same E-mail message whenever he was mad at me. To get back at him, I devised a ridiculously simple yet extremely annoying C program that mailed him the same E-mail message 1000 times!

I have figured that that program would be the perfect weapon against Sinclap now that he has to pay for his mail. However, I wouldn't use this program myself because I think it is unethical to make the other users of his Internet service suffer for his sins. However, there is nothing to stop me from posting the source code for anyone who has no such qualms.

Well, here it is folks:

```
/* Evil C mail program */

#include <stdio>

main()
{
int i;

for (i = 0; i < 1000; i++)
{
system (mail -s "WELCOME TO CH. 11!" sinclair@ins.infonet.net < mess");
}
}

/* End of source code */
/* No Copyright. Copy and distribute at will. */
```

Where 'mess' is the message that you want to send him.
This program was written for UNIX, but can easily be modified
for other systems.

HE HE HE HE HE!!!!!!!

* Tom

PS: Top this program MR. CLAP!!

What is more powerful about drag 'n' drop on the Mac? On the
Falcon, I just specify what filetype the app should deal with
and when that type of file is dragged to the icon or double
clicked the application will launch.
I also think TOS seems faster to me on the Falcon than System 7
on the LCIII (the LCIII is faster than the Falcon, right?).
One thing that seemed slow to me is the opening of windows.
I would double click on the drive and wait as each icon popped
up in the individually. TOS opens the window with all contents
displayed instantly.
Okay, I see your point about the bombs. I will concede this.
However, my Falcon bombs less frequently than the mac anyway....
:-)
Oh, I have seen At Ease on the Performas. For some reason it
did not ring a bell.
As far as fonts go, I personally like SpeedoGDOS. Have you used it?
Also, why does the mac seem to take so long to print things? This
observation came from using Quickbasic and Works on the Classic
so I suppose it could be faster on other OSs (7) or under other
apps.
Another thing that I don't like about the Mac is the Filetype/
Creator business. I haven't used a Mac long enough to understand
what all this business is about (it was created on an IBM instead
of a Mac?) but it does seem annoying.

Good point. The Mac is as crash prone as any. CDEV and INIT problems
abound. All kinds of software that won't work with each other.

The basic problem is that you are adding stuff into a single tasking
machine. You never have these problems on a machine with a multitasking
OS (or a good one anyway). No need for accessories, TSR's, CDEVs,
INITs, and all that stuff when you can just start another program
running.

>Finally, this is not a flame.... are there any good alternative

^^^ ^^^^^^^

This isn't a flame either but Neodesk is not an OS. Nice file manager
(or whatever you should call it) but not an OS.

Thats pretty fast since Motorola only rate the 25MHz '040 at 19.2 MIPS.
Scale that up for a 33MHz '040 and you only get 25 MIPs.

> >68060 is 100 MIPS.... (Fusion '060 avialable direct from RCS right now)

I could believe 100 MIPs, they skiped the '050 to make the 68K family more
RISC like. Most RISC chips can do 100 MIPs easily, especially if you're
talking NO-OP MIPS ;-).

> MIPS?! Hmmm... I was hoping for something more like Specfp92 and
> Specint92 ratings.

I think you will find that the SPEC marks rating system is only used by a
closed syndicate of companies. The algorithms for calculating these are
not generally available.

I can't see how the stability of INITs and CDEVs would be enhanced by a preemptive system. The basic problem with INITs and CDEVs is they tend to patch operating system code. That means that they break when two INITs/CDEVs compete for the same routine or the coding of the OS routine changes.

There IS an easier way to see who is right... Anyone with either
a BASE excalibur 040 board? test to see how fast it is and post it.
Right? I, unfortunately, am still waiting for my Cyberstorm board, which
I ordered this past saturday. BTW, what software on the C= measures
MIPS or speed?? Where can I get it? Thanx.

>> MIPS?! Hmmm... I was hoping for something more like Specfp92 and
>> Specint92 ratings.

But like before does such testers exist for C=
or INTEL-Compa't machines (I know DEC uses it for their systems, so it
would make a direct comparasion between my systems:-))

Atari still produces the Falcon and the TT. They are producing
many, though, and probably will update the line soon. There
is talk of clones coming out (the Medusa '040 is out but tough
on the wallet).
The Falcon is based on the 68030 at 16MHz, has a DSP (56001 I
believe), has built-in Midi, 16-bit graphics, 16-bit stereo
sound.... It is a very nice machine, IMO.
The TT is based on a 68030 running at 32MHz (cheap upgrades
accelerate this) has built-in MIDI ports (all Ataris do actually)
doesn't have the same graphic capabilities as the Falcon
(what are those specs, guys?). The TT is more of a powerhouse
than the Falcon but the Falcon has better graphics and sound.
IMO, the Falcon and TT do everything better than IBMs :-).
The problem is that software hasn't come out to prove this.
The OS crushes the DOS/Windows setup (again IMO). But then again,
the Amiga's OS is pretty keen too, right :-)? The Atari setup
is most often used for musical or DTP work. The support is
less than you'll find for the Amiga, though.
Pretty much what I'd say is that the Atari is a FUN computer
to work with. The Falcon can easily do what most people want
to do in a user-friendly way. It is expensive, though ($1300
for a 4/85 setup).
I don't know if the rambling helped. Hope so.

If Atari is producing many, Why are sales almost non existence? Atari's sales
in the last quarter was $8 million, almost all Jagflop..

>The Falcon is based on the 68030 at 16MHz, has a DSP (56001 I

$1300 for a fun computer. I think the $1199 Q630 is a better buy because you
can add inexpensive audio-video boards and quicktime..
The Falcon is a bad deal. You even have yours for sale...

Ah, but there are things like the 25fps MPEG player available in
SOFTWARE for the Falcon. Can your Powermac do that Peter ? <smug
grin> Email griff to ask him about it :-)

(This I got from Rob@Systems Solutions who say they may even be
marketing the logical development of this: an MPEG player that plays
the file from CD, in truecolour at full MPEG resolution (which is
apparently only 320x240, but in TC this won't matter as much)

Again, email griff for details :-)))

Simon.

Message-ID: <a27_9409170517@softtech.brisnet.org.au>
Source record: 15659

Hi there well yes Atari is still a manufacturer they make a 68030 machine called a Falcon. As they don't make any Atari accessories(monitors , printers, etc.) they don't have a large overhead with regard to it so they don't advertise it much. Also there is a german clone called a Medusa T40 a 68040 machine built in the Dos Box stile with mini tower and a large number of card slots. reports on it are garbled but they are talking L3200UK and screen res of up to 1024x768 pixels with 256 colours and all sorts of other goog bits. Strangely enough one mag showed the inside of one, pointing out a large board at the rear and saying it was an ST on a PC plug in board. It uses an enhansed version of TOS 2.6 (1 meg). The Falcon is impressive too but it is a comsole machine. You can however get a tower for it from the U.K.
Anyway I hope that is some help.
Seeyoulatermate,
Geoff of OZ.

: than Mac/Ms Dog platforms.

: I'm willing to give anything a try... I mean I own an Amiga to.

The only new computer Atari has for sale is the Falcon. But, now third party companies are shipping high end Ataris. There is a TT clone, and a Falcon clone comming.

I understand you fustration with the IBM, I own one as well. I also own a Falcon. Planning to start uprading it with lots of stuff. :)

If you can find a used system, grab one. If you want to get a new one, get one without the hard drive, and you can plug your own in. It only has support for 2.5" IDE inside. But, you can hook up a SCSI outside, or buy these 2.5" to 3.5" IDEs adaptors. I know one person who fit his 3.5" inside, at the cost of the internal speaker. (darn!) :)

I don't have a Jag yet, but plan to get one real soon.

Vince

How about using something like the Dhrystone and Whetstone pair of benchmarks
then (source can be dredged up from archie somewhere I believe)? At least
these remove the ambiguity of MIPS (are we talking native MIPS or VAX MIPS
here anyhow). I'm sure I could design a processor that ran at some ungodly
number of instructions per second on a ten way superscalar architecture
as long as you didn't want it to actually compute anything (ie all instructions
decode to NOP) ;-)

Someone made the mistake of buying a Mac ni my family and as a result I am stuck with the default idiot proof and hence unusable OS that comes with the Mac. I dont want to conform my every keystroke to the great dictate of Crapple Computer.

So I want Unix for my computer. DOS sucks and Windows blows so dont even mention those. Linux would be ideal since it is the best PC OS and free to boot. I'm not sure if anyone here would know of a free Unix clone for the Mac that is actually functioning (so A/UX is out it blows the big one).

Please help me get rid of the MacOS. I know you probably like using it but hey my choice and my opinion are mine. Death to MacOS and Crapple Computer

I guy emailed me saying that it was freely available. When I asked where,
he said you have to pay for a distribution of the relevany source code.
So I guess that the term free is used slightly differently.

But don't you think that the first thing Intel and Motorola (and DEC
and MIPS and Acorn ....) do when they release a new processor to the
public is to run the SpecSuite on it? Come on, those beasties take
hundreds of millions of dollars to design, so who cares about a 5 digit
sum to get the sourcecode for the only widely accepted benchmarks?

Well Scott another Atarian got on an Atari node and got up your nose did he. Scott i'me sure that these inexpensive boards you talk about for your computer will not be so inexpensive as not to bring the price of your computer up to or may be even over the $1300.00 mark. It has been my experience that the Falcon does not need an audio and or video board and or whatever the other thing you are talking about. The Falcon is a stand aloan platform and does not need any adons. If it does not do what you want it to do then dont buy it. Now since this is an Atari node and all you seem to be able to do is attack Atari people who use it and since we give
you so much agro why dont you discontinue down loading this node and help out your blood pressure.
Don't get angry just go away.
Catch you later

You seem to be missing the picture here. Perhaps you need 'advocacy' defined for yourself? -MB-'s postmaster, I would guess, rarely gets any complaints about him. You, on the other hand, are often significantly ruder in your posts. You seem to think that 'advocacy' includes insulting as much as anything.
But maybe I souldn't have told you this - most subscribers of this group probably prefer that you continue your behavior until you get axe again.

Not that I think that everyone should harass Kevin just because he has the
terrible misfortune of being Sincrap's postmaster, but if Sincrap gets out
of control again (as he will eventually, mark my words!) don't hesitate to
complain to Kevin about our (least) favorite net pest, Monsieur Pierre
LeCrap.

>marketing the logical development of this: an MPEG player that plays
>the file from CD, in truecolour at full MPEG resolution (which is
>apparently only 320x240, but in TC this won't matter as much)

I can get about 30fps playing a 316x236 movie using 32-bit color. So that leaves 24-bits of "true" color. This includes a 22.2 kHz mono sound track. The total data thoughput is 21.7K/s audio and 231.7k/s video. This data is from the one QT movie I have so it may be possible to get the same fps with better audio and a larger window size. This is still getter than your Atari though since you never mentioned an audio track and your "true color" is 16-bit.

: Hi there well yes Atari is still a manufacturer they make a 68030 machine
: called a Falcon. As they don't make any Atari accessories(monitors ,
: printers, etc.) they don't have a large overhead with regard to it so they
: don't advertise it much. Also there is a german clone called a Medusa T40
: a 68040 machine built in the Dos Box stile with mini tower and a large
: number of card slots. reports on it are garbled but they are talking
: L3200UK and screen res of up to 1024x768 pixels with 256 colours and all
: sorts of other goog bits. Strangely enough one mag showed the inside of
: one, pointing out a large board at the rear and saying it was an ST on a
: PC plug in board. It uses an enhansed version of TOS 2.6 (1 meg). The
: Falcon is impressive too but it is a comsole machine. You can however get
: a tower for it from the U.K.
: Anyway I hope that is some help.
: Seeyoulatermate,
: Geoff of OZ.

They do, in fact, make monitors. The PTM and PTC monitors for the TT, the SC1435 stereo colour monitor, and the SM142 (I think that's the newer model). And Atari are also still manufacturing the TT030 as well as the Falcon030.

Atari is handled incompently by present management. If atari sheds it's
present management, than the company may have success in the market.
Everything that the Tramiels have done have flopped. Remember the 5200, 7800(I
own one), the XE games system, the Lynx(I own one), the ST, TT(whats in a
name), the Falcon(Thats why Stires sold his) and now the Jagflop..

>And why do you always post your Mac propaganda in c.s.atari.adv instead of

In the Sept 94 issue of Unix Review there was an ad inside the back cover for a Unix for the Mac called Mach10. It multitasks with the Mac's OS. It's produced by a company called Tenon Intersystems at 1-800-6-MACH-10. The only price they list is that it's under $500 (probably $499.99 :).

I wish someone would write a Mach Unix system that would multitask with the Amiga's OS. I wonder what it would take to create an Amiga personality for Mach.

Chris Hall

To all experiencing problems with Brutal sports Football on the ATARI Jaguar game console. A number of game catridges are slightly incompatible and cause some strange effects, two that i have noticed is one being redrawing the screen so it is uncomprehensible, the other is acting as if the console has been switched off.

I called Telegames at 1-214-228-0690 and they gave me a code to enter into the password selection option.

>own one), the XE games system, the Lynx(I own one), the ST, TT(whats in a
>name), the Falcon(Thats why Stires sold his) and now the Jagflop..

Comment #1:
"incompently" is usu. spelled "incompetently".

Comment #2:
Are you implying that Atari named a computer after me (The TT). I'm honored. :-)

Comment #3:
You still haven't explained what they have done to you personally. They must
have done something to you to make you have such a vendetta against them. I
think that the Atari mgmt. is incompetent also, but I don't hate them. If you
don't like Ataris, fine. Just don't buy any.

>>And why do you always post your Mac propaganda in c.s.atari.adv instead of
>>c.s.mac.adv where it belongs?

>This is advocacy isn't it. There is Intel and Amiga proproganda in mac
>Advocacy as well.

This doesn't answer my question. I was asking why you didn't post in c.s.mac.adv,
not why you did post in c.s.atari.adv.

>>BTW are you frustrated that your Mac won't date you? ;-)
>Eh..

Guess you are. ;-)

Linux for Amiga/Atari is available at FTP sites :

tsx-11.mit.edu/pub/linux/680x0

is you can use the WWW the URL is :

http://www-users.informatik.rwth-aachen.de/~hn/linux68k.html

Have fun ...

Anand.

Tom,
Check out either Current Notes or ST Informer (or both!).
They each would be happy to give out a sample copy and both
are very good mags, IMHO. Atari Explorer was good to get Atari
Corp.'s spin on things but it really wasn't "hard hitting."
CN and ST Informer (CN more than ST-I) "tell it like it is."
While you're flipping through the pages you may notice
Rising Star Computer's ads. They sell cheap, used STs.
Come back to the fold, Tom ;-).

Tom,

The hard copy version of Atari Explorer has been defunct for a couple
of years now. Atari felt that it couldn't devote the time and resources
to keep it going.

Will it multi-task with the native AmigaOS? I've thought about just getting a bridgeboard and running NetBSD on it so that I can have both enviroments at the same time.

Atari Explorer Online is available on the University of Michagan
FTP site. Check it out. It is great, as Pete said. And if
Atari Explorer is always glowing about Atari Corporation how
could we describe Pete's attitude towards Apple? :-) Maybe
these two net sources counter each other :-).
Tom, e-mail ST Informer at: st-informer@genie.geis.com. You
can reach the CN ST Editor at: plefebvre@delphi.com, I think.
Either that or it is plefebvre@genie.geis.com. If these are
wrong I can look it up for you :-).

In article <quinlan.779750329@sfu.ca>, quinlan@kits.sfu.ca writes

! >Ah, but there are things like the 25fps MPEG player available in
! >SOFTWARE for the Falcon. Can your Powermac do that Peter ? <smug
! >grin> Email griff to ask him about it :-)
!
! >(This I got from Rob@Systems Solutions who say they may even be
! >marketing the logical development of this: an MPEG player that plays
! >the file from CD, in truecolour at full MPEG resolution (which is
! >apparently only 320x240, but in TC this won't matter as much)
!
! I can get about 30fps playing a 316x236 movie using 32-bit color. So that
! leaves 24-bits of "true" color. This includes a 22.2 kHz mono sound track.
! The total data thoughput is 21.7K/s audio and 231.7k/s video. This
! data is from the one QT movie I have so it may be possible to get the
! same fps with better audio and a larger window size. This is still
! getter than your Atari though since you never mentioned an audio track
! and your "true color" is 16-bit.
!
I think you've totally missed the point. No offence, but playing an
MPEG movie is a *damn* sight more difficult than a QuickTime movie
and a lot more computationally intensive. That's why the file size
is a lot smaller. You can't get QT video-CD's can you ?

I don't know about audio (I haven't got the s/w yet, there's a
new 30% faster version just been announced). but I dare say that
watching a video-CD would be a bit dull without sound :-) I'd say he
has to put sound on to it really...

I think there's an FLI player that goes like greased lightning (works
on the DSP again), but I've no figures for that - I'll try videoing it
to get a rough frame-rate...

ATB,
Simon.

CH Time SW F GFA Uhr stellen.
CLR Demo SW GFA Programmiervorschl�ge.
Dir SW F GFA Checkt Disketten nach Files und Folders.
ED Sprite SW GFA Sprite- und Mouse-Editor
GFA Mice SW Spiel GFA Nicht 100% lauff�hig.
GFA Shell SW F GFA, zum besseren Handling beim Arbeiten mit
Compiler
Globe F GFA-Demo zeigt schnellen Aufbau von 3 D-
Kugeln
Kalender GFA Kalender nach Wunsch!!!
Master F Mastermind (Superhirn) Stragespiel GFA
Microcard F GFA Zeichenprogramm
Pacman F 2 Pacman Versionen GFA
Scorfour F Vier Steine in einer Reihe GFA
Sensori F Spiel GFA
States F Strategiespiel GFA
TI TA TO SW GFA 3D Tic Tac Toe mit vier versetzten
Brettern �bereinander. Alle Bretter werden
gleichzeitig gespielt. 1 oder 2 Spieler.
GFA Basro SW F 41261
192 ST Klick SW F Notiz, Wecker, Schreibmaschine, Rechner
Kalender mit Tagen und Monaten, Druckeranp.
Mac Pan SW Der alte PAC MAN aus der Spielhalle.
Term SW Umfangreiches Terminalprogramm
X Ref SW F Anpassung von C Programmen, die f�r andere
Rechner geschrieben wurden.
Invaders SW Eine neuere Umsetzung des alten
Spielhallenspiels.
Andruil SW Geschicklichkeitsspiel mit 75 Bildern.
Diamon SW Vielseitiges Spiel mit 30 fertigen Levels,sehr
schneller Grafik und Feldeditor.(Boulder Dash)
Minefilds SW wagemutiges Spiel in einem Minenfeld.
Data Text SW Datenverarbeitung
194 Sprache SW F Softwarem�ssige Sprachausgabe
ZeitmanagerSW GFA Sehr �bersichtlich und gut durchdachtes
Zeitplanungskonzept. Super
Carpet SW Berechnungsprogramm von 3D-Funktionen.
Hiddenline,Algorithmus und Beleuchtungseffekten.

3 D Plott SW Berechnungsprogramm von 3D-Funktionen
mit einigen Extras.
Funktion SW Plotterprogramm mit verschiebbaren Achsen,
mehrere Darstellungsarten m�glich.

Tops SW F The Other Pascal Shell (Pascal Plus)

198 RCS ICN SW Icons einfach erstellen.Bildschirmbereiche
werden einfach umgewandelt in Icons.
Anlage SW Anlage / Aktien / Investmentverwaltung
Depot SW Aktiendepot
Aktie SW F Aktienverwaltung
Regelpro SW Simulation einer Regelstrecke
Berechnung und grafische Darstellung.
Schaltplan SW elektronische Schaltpl�ne mit Hilfe von
Schaltsymbolen selber entwickeln.
Rotax 4.0 SW Animation und Rotationsprogramm von 3-D K�rpern
Pic Switsh F V0.5 Darstellung verschiedener Bildformate.
RSC INN SW F Ausschneiden von Bildschirmausschnitten,
zur Weiterverarbeitung zu ICONS
200 Poster SW Druckt ein Bild in vierfacher Gr�sse.
Ausdrucke lassen sich dann zu einem Poster
zusammenf�gen.

ZS Editor SW Zeichensatzeditor f�r 24-Nadeldrucker
(P5/6/7 und andere). Down-Load Zeichensatz.
Basic Ref SW Crossreferenzprogramm f�r GFA-Basic.Hilft
mit vielen Optionen, Fehler aufzudecken.
Incl.Source in GFA-Basic.
MSK Edit SW GFA Maskeneditor f�r GFA-Basic.Generiert mit
einfacher Bedienung eine komplette
Eingabemaske als Quelltext (Form Input).
Retten SW Fortran. Speichert zu lange Dateien in mehreren
Teilen auf verschiedene Disketten.
Seco SW F GFA Verwaltet Bildausschnitte (mit GFA-
Basic-Befehlen PUT GET verwendbar) und
f�gt sie zu Bibliotheken zusammen.
World SW Lernprogramm. Fragt alle L�nder und
Hauptst�dte der Welt ab. Dabei erfolgt die
Antwort per Mausklick.
Enthaltene Landkarten: BRD, USA, Ozeanien,
Mittelamerika, S�damerika, Europa, Asien.

Kreuzwort SW Generiert Kreuzwortr�tsel.
203 Imperium SW Kaufen und verkaufen von �lfeldern, Pumpen,
Tankwagen.Nat�rlich ist auch Sabotage
enthalten.Wettbewerb vorrausgesetzt.
F1 Manager SW Sie m�ssen einen Formel-Eins-Rennstall
verwalten. Ausr�sten von Autos, Verpflichten
von Rennfahrern und einiges mehr geh�rt dazu
BOLO SW Wahrscheinlich die beste Arkanoidumsetzung
Columbia SW Malprogramm mit vielen Optionen.
Kermit v1.1SW F Datenfern�bertragungsprogramm

204 RAM SW F ACC zeigt freien Speicherplatz.
Paintlux SW Sehr umfangreiches Malprogramm. 3
Ein Muss f�r jeden Monochrombesitzer.
Inhalt SW Erzeugt eine Index-Liste von 1st Word-Texten.

Kopieren Sie einfach alle W�rter,
die ber�cksichtigt werden sollen, in eine
Datei."Inhalt" f�gt nun die Seitennummer an.
Index SW Programm zur Erstellung einer Seitenindexliste,
alphabetisch sortiert, Liste aller Zeilenlineale
und aller Bilder. Weiterhin wird ein Lexikon
aller vorkommenden W�rter erzeugt, mit Wortfilter.
BT Konvert SW Konvertiert 1st Word-Texte nach Becker-Text.
Incl. Sonderzeichenumwandlung und Schriftartanpassung.
Type SW Schreibmaschinenkurs in �ber 40 Lektionen.
Von einzelnen Buchstaben bis zu ganzen W�rtern
werden Aufgaben gestellt und bewertet .
Plotter SW F Darstellung von Werten in Diagrammen.
sehr aufwendig und vielseitig.
Morse SW F Morselernprogramm, mit Angabe der T�ne,
und Abfragen der Buchstaben und W�rter.
206 L Painter SW Malprogrgramm Rasteroperationen, Musterspray,
Verwischen, Drehen, Biegen,
Blockladen und Speichern, Fontloader.
Minigolf SW 18 Bahnen , Steuerung per Maus
Richtung Anschlagst�rke. Sehr Gut !!
Solit�r SW Dreidimensionales Solit�r mit guten Grafiken
Deutsch und Franz�sisch.
Roulette SW Was mag das wohl sein?
Surface SW einfache aber sehenswerte Strichdemo
Mazemaker SW F erstellt ein Labyrinth.
Setmaus SW F ACC Mauseinstellung 3 fache Geschwindigkeit,
CAD SW Student CAD nur altes TOS
Gut gestaltetes CAD Programm mit vielen
guten Optionen.Vergleichbar mit kommerziellen
CAD Programmen.
209 Schloss SW F Textadventure
Squixx SW Altbekanntes Spielhallenspiel f�r Maus
und Joy-Stick.Ziel:F�llen von Fl�chen
im Kampf gegen Steinbeisser.
StundenplanSW F erstellt Stundenplan nach Wahl.
APPLE ST SW F �bertragen von Textdaten zwischen ATARI ST
und APPLE �ber v 24 als GFA BAS + PRG.
Cartoon SW einfaches Zeichentrickfilmprogramm.
Erstellen von Animationen m�glich.
MIDI Mus SW MIDI Programm 1 MB und Keybord erforderlich
sehr �bersichtlich und professioneller Editor.
Einspielen �ber Keybord, Noten ausdrucken.
Erstellt f�r Yamaha PC R 800.

210 Kreuz AS SW Eine sinnvolle Art, mit dem Computer zu
spielen, ohne einen Pfennig Einsatz.
Nachahmung des gleichen Gl�cksspielautomaten.
X Modem SW F Datenfern�bertragung

AMIGA Demo F 100% Funktion wird nicht gew�hrleistet.
Spriter SW Sprite Editor
Denk Mal SW es weden Farbe und Ton vorgegeben, und
sollen nachgespielt werden. 3-6 Felder.
Deconv SW Deconvolutionsprogramm zur Bestimmung
von Abklingzeiten.
Bilanzen SW Kontenverwaltung mit Monats,-Jahresbilanzen,
Balken und Kuchengrafiken,sehr �bersichtlich.
Dakar Sw Dateiverwaltung
Rechnen SW F Wirtschaftsrechnen f�r B�rokaufleute.
Funktionen:Zeiteinheiten, Z�hlmasse,
Englische L�ngenmasse,-Gewichtseinheiten,
L�ngenmasse, Gewichte, K�rpermasse,
mathematische Berechnungen, Datenumwandlung,
Zinzrechnung, Dreisatz, Lagerkennzahlen,
Buchf�hrung, W�hrungsrechnen, Prozentrechnung,
Diskontrechnung, Kalkulation, Verfallzeit
Durchschnittsrechnung, Kurswert,u.v.m.
Auf jeden Fall zu empfehlen.
Zeichen SW F Grafikprogramm f�r alle g�ngigen Formate,
mit vielen neuen Funktionen und neuen Ideen.
Z.B.Ordner erzeugen, sroll, 4 Spiegel,q
Spiegel, Mausi, Gag, Effekt (horizontal-
vertikal), Tausch, Peil, Baum, Rahmung,
Kantenform,Mausiform, M-Kreis, Hardcopy.

216 Deskblue SW Gibt dem Desktop ein neues Gesicht.
alle Programme laufen einwandfrei(4 Wochen Test)
Lotto SW F Lotto Analyse. Chancensteigerung durch
Analysierung aller vorhergegangenen Ziehungen.
Eingabe der folgenden Ziehungen m�glich.
Morsen SW F Morsen �ber Centronics-Schnittstelle.
Erweiterung f�r Funkger�t ist m�glich.
Senden von Buchstaben, Kennung, Zeilen u.Dateien.
Morse ST SW Morsetrainer (nicht 100%, aber sehenswert)
Picsw 0.7 F Darstellung und Drucken von Degas PI1-PI3,
NEO, Tiny, NVision, Amiga IFF, Mac Paint,
Mac Startup, CIS Vidtex und alle Atariformate.
QTH LOC SW Programm f�r Funkamat zur Festestellung der
QTH Kenner.Sehr sch�ne Grafiken und Karten
Ratte SW lernende Ratte in einem Irrgarten
REM EX SW F Entfernt REM aus GFA Basic Programmen.
Mazemakr SW F Erzeugt ein Labyrinth f�r Bildschirm u. Drucker
M Help SW F ACC Hilfsprogramm mit den Funktionen:
Disk Formatieren, kopieren, Ordnernamen �ndern,
Disknamen �ndern, Directory drucken.
Netz SW Bestimmen Sie die Gr�sse einer Netzlandschaft.
Kprinter SW F Kassettenh�llendruckprogramm f�r Audiokassetten.
227 Sammelsorium der gebr�uchlichsten Accessories mit ACC Loader

Weller ToolSW F Setup. Auto-Programme, Accessory Auswahl,- und
Lade-Programm mit sehr vielen sinnvollen Infos.

300 Sagrotan sw/f Virenkiller der Version 4,17 mit �nderung des Bootsektors
(auch f�r MS-DOS kompatibele Disketten !)

400 STZIP.TOS Selbstextrcting-Progrmm zum Packen/entpacken von
*.ZIP-Files (auch DOS-gepackte!)
500 RUFUS Terminalprogramm
600 Starcall Terminalprogramm, voll ANSI und Color, sehr gut
610 Starbox Mailboxprogramm, l�uft unter Starcall !
700 Trapido noch ein Terminalprogramm

sowie diverse Spiele (auf Anfrage)
* Liste f�r MS-DOS- PD ist in Arbeit !*
*** linke Zahlenangabe ist nur fuer mich relevant,bitte Files angeben !***

Weitere Programme sind schon im Test/auf Anfrage. Ich werde das LISTING
in der BOX st�ndig aktualisieren! (und auch die Programme !)
Ich biete die M�glichkeit, Einzelzusammenstellungen nach individuellem
Wunsch zusammenzustellen !(als ST-ZIP-File) oder im Versand.

Dazu ist entsprechendes Leerdiskmaterial und eine Anforderungsliste erfor-
derlich. **->Bitte R�ckporto beilegen oder frankierten Umschlag !<-**

Wir wollen keinen Handel treiben , sondern TAUSCHEN !!! Also- wenn gute
(aktuelle Programme ***nur PD- und Shareware oder FREEWARE***) bei Euch
vorhanden sind, (auch TEST-Versionen neuer PRG oder Updates) - bitte
eine MSG schreiben oder direkt zuschicken ! (oder in die BOX laden!)

Alle Programme k�nnen gepackt werden (auf Wunsch mit entspr. Prg)->Stan-
dard ist momentan STZIP<- **damit die Disk VOLL wird !**

*** Format derzeit (max.) 960 KB bei 720'er 3,5'' Disketten ***
* mit Tricks (Dos-Formatierung) auch h�her) ** ->Fehlerquote auch !
MS-Dos k�nnen wir bis 1,4 MB auf 3,5'' Disketten fahren.(HD und DD)

Ich finde, das ist ein faires Angebot, wenn man den Aufwand ber�cksichtigt!

Ok, as a first time poster, i'll apologize for anything upsetting it
the following text.
(so, done! Flame shield is UP! *8))
I suddenly remembered my old (OLD) atari 1040STFM,
lying in a box totally in peices, and thought to myself

- Wonder if I could connect it to my modem (2400Bps), and sotof
connect it to my schools modempool, and read my mail?

After some small assambling (of peices), and some checking of disk's,
(with about 60% or so broken/jumbled)
I came to insight of what i had to work with:
1 atari 1040STFM, one 2400bps hayes modem, and (gasp) KERMIT.
(and yes, it DOES connect to the computer, AND to my school. WHEE!)
so, what to do now is one teeny-weeny bit of improvement,
to replace the KERMIT ver. 1.05 beta (or something) to a neater,
nicer, more user-friendly communications tool.
I finally am tired of manually typing ATD<nr>, ATH, AT&W AT<foo>......

Any suggestions?

Oh. Uhm. Since i dont hang around in this newsgroup too much
(actually, firsttime-visit)
I'd rather have reply's by mail to
d92-pro@nada.kth.se
(and yes, I will trim up the answers, and repost them on request)

/Many thanx in advance,
Phil

Re. all the bollocks about Mr Sinclair.

This is absolutely pathetic. Why don't you bunch of whining 3 year olds
fucking grow up. I could not give a flying fuck what Peter or anyone else
says about Atari or _me_ for that matter. What difference does it make?
If Peter thinks Atari are shite then advocacy is the place to say it. If he
gets abusive, ignore him. If he starts mail bombing you then complain
to his sys. admin. However, whining on that Peter said nasty things about
Atari and called me a dork, I think he should be thrown of the net is bollocks.
If you are so thin skinned and sensitive then don't subscribe to any usenet
groups, stay at home and line your room with cotton wool. Better still post
a personal in soc.singles the response you get to that will toughen you up.

You bunch of arseholes. Atari are the worst company in World. The Jaguar is a
flop and can't texture map worth a fuck (although I can't wait for AvP which
proves you don't need texture mapping for great graphics)

BIG HUGE CHEESY GRIN.

(There complain to my sys. admin. whoever he/she is)

>>I was wondering whether or not it is still around.

>It's now Atari Explorer online. The official propaganda tool to put the spin
>on Managements incompetence..

Thanks for the info, Peter, but I've already been told that Atari Explorer is
now an online magazine. As for it being Atari's official propaganda tool,
you're right in this case. I got that magazine (when it was still in printed
form) for over 7 years, and I NEVER EVER saw it say anything even moderately
negative about Atari! It also, in its later years, portrayed Jack Tramiel as
a god (I don't hate his guts like you do, but he's definitely NOT a god!).
However, I have also been informed thru E-mail and posts that there are
other online Atari mags that are independent of Atari and tell what's REALLY
going on. I think I might investigate one of those and forget Atari Explorer.

BTW on a different topic, how do you speed up the ridiculously slow Mac
Newsreader program. It takes it 10 minutes to do what nn can do in 10
seconds (assuming it doesn't run out of memory and crash the computer)!

I ran it on a Centris 610 (the Macs they have at school). What is the processor/
speed of this machine; and why didn't Apple come up with a decent naming scheme
until it released the Powermacs (Centris 610 is an arbitrary and useless moniker)!

Wondering why I am even USING a Mac at all!? Well, I'll tell you why, even though
you'll have a field day over it. This semester I have to TA an intro-to-computers
class that uses Macs. Inorder to do this well I, unfortunately, have no choice but
to bite the bullet and become proficient in using those lousy machines that I have
despised for so many years. Oh well..life sucks, what can I say. <sigh>

Tom,

Ironically, STReport online magazine is currently putting together an
E-Mail distribution list for our weekly issues. This will make things
easier for those on the Internet who have no other sources to get the
magazine. If you're interested, I can add you to our growing list of
"subscribers".

What does any of this particular line of comments have to do with
Atari? I don't care (nor do I have a problem) that CNN has a
Blackbird at the anchor's side. Neither do I care that Peter
Sinclair doesn't like Atari (although I do not understand why he
frequents this newsgroup), he has just as much privilege to be here
as I do. Please take all of these comments to .advocacy or e-mail.
I have little interest in reading this garbage, and since it contains
nothing about Atari, it serves little purpose in being here.

STReport will be branching out to Internet users in the very near future. Since I've started to avail myself of Delphi's Usenet access areas from within the Atari area, I've received numerous requests to receive STReport from a variety of Internet addresses. So, we're putting together an Internet distribution/mailing list for those who wish to receive STReport on a regular basis, and we'll UUENCODE each issue and mail it to you. If you're interested in being added to our mailing list, please drop me some mail at "dpj@delphi.com". Look for mailings to begin by the start of October. We are also considering a number of Internet ftp sites to post our issues as well. Whatever we can do to make STReport available to you. we'll try it!

Howdy Guido:

1. Somebody mentioned Mach for the Mac. I have no information whatsoever
about this product so I will decline to comment about it.

2. MINIX for Mac. It runs on top of System 6.X. It is a pain to install
and it only gives you three windows. It does not have GUI support AFAIK.
However it multitasks and it looks like UN*X.

3. A/UX.. It is from Apple. I've seen it and it is not as bad as it seems.
It is a nice thing that let's you run finder applications, you do not have
to buy a lot of them. But it is expensive.

I'm out of here.

Rutgers doesn't use vaxes - it uses Suns (no, I don't know which one). Of course I'm not convinced yet that its the server that's the problem. It might be the fault of that losey networking software that they bought from Apple. It also might be because each Mac only has 12M of memory, woefully inadequate since that slow, bloated OS that the Mac uses, System 7, requires 8M by itself!

>As for the newsreader program, I am not sure what you mean. I use Zterm to
>access my internet provider and hit 2 from the menu to access the usenet and it

My experiences of A/UX at work is that its a pretty crap product.
Its used in a Mac fileserver and has thrown up all sorts of problems.
I haven't seen it being used as an applications platform, but I
doubt it would be much good as apple seem to just package it as a
fileserver product. IMO they'd have been better writing software
to let a Sun or HP act as server, along the lines of PCNFS.

My experiences (and countless others) is just the opposite.

By the way, A/UX _started_ as a desktop OS, Apple then decided to use it
for their AWS95 server, since the combination of A/UX and AppleShare Pro
blows away the "plain" MacOS and AppleShare... even on the PowerMacs.

What Constitutional rights are you talking about? You don't have rights on
the net, only priveledges.

of ownership...

Last I heard, three of Apple's largest publishing efforts were done with
UNIX machines running typesetting software.

I don't know what to tell you. Before the Cobra was installed, the previous system was slow and affected Macs and PC's as well.

The Centris 610 I am using has System 7 consumming 1.5 megs of ram. This supposely slow bloated OS does more than your generic Atari OS as well as the the usless Amiga OS that can only formatt a floppy and play a Atari 2600 Style game..

Pete,
In what way is the Atari OS "generic"? This is kind of an odd
term. BTW, my generic OS can do pre-emptive multitasking.
Can System 7? Just curious :-). What other advantages does
the amazing System 7 have over TOS 4.04? BTW, just running
TOS 4.04 without MultiTOS takes up almost no memory(!).
What is the lowest RAM that System 7 needs? It is much more
than TOS. And, heck, if I want to get rid of that "generic"
OS/Desktop than I can choose from many replacements like
Magic, Neodesk/Geneva, Teradesk, Kaosdesk and Gemini.
Of course I can get At Ease for the Mac (ha ha!). A desktop for
those who can't figure out that daunting System 7.
Pete probably has At Ease installed.

I know this revelation will shock no one, but Sinclap has just proven to me what I have believed all along: THAT HE HAS NO LIFE!! I mean, if he actually had a life, why would he have sent me a 10-page Apple press release at about 8:00 on a SATURDAY NIGHT!

I was in the computer lab at the time that I received the message, desparately trying to finish a program that is due this week. If it were from anyone other than the Clapmaster I would have been shocked! I mean, aren't there better things to do on a Saturday night than send people stupid E-mail messages, especially WHEN YOU ARE NOT EVEN IN SCHOOL!! And I he doesn't have a job right now either - I mean, who in their right mind would hire this guy!?

In any case, the message is now in my mbox file, and I am willing to post it if anyone wants proof that what I am saying is true. Most people will proba-bly take my word for it tho - I mean it's not like this action of his is out of character for him.

And to you Sinclap, if you send me anymore of your pathetic Mac propaganda to me, I will mail it back to you - 100 TIMES - with my C mail program.

And one more thing, Sinclap. If Apple is so great and mighty, why did they have to turn to IBM in order to bail them out!? If it wasn't for IBM and its PowerPC chip, Apple would have sunk to the same depths that Commodore has fallen to by now!

I hate to argue, but if you have plain System7 with no other extensions
installed on a low-end machine (like an LC) it can take as little as 1.5 megs.
However, to make it useable in any way (useable to anyone who knows how a
computer should work - i.e. not a mac worshipper) takes much more, as does
installing custom sounds & such.

~Chris

Turn to IBM to bail them out? What do you mean? Motorola, Apple and IBM
co-developed it. Its called shared development costs and makes financial sense
to me.. Apple's Quadra and PowerBook line make up the bulk of Apples sales.
But by 1995, the reverse will happen when the PowerMacs will be Apple's
bread/butter.

Fine, go ahead!!
And what exactly is Prozac anyway?
Some drug that you are addicted to Monsieur Pierre LeCrap!?

>>And to you Sinclap, if you send me anymore of your pathetic Mac propaganda to
>>me, I will mail it back to you - 100 TIMES - with my C mail program.

>I can do the same.

Yeah, right!!

You mean you can actually program, Sincrap!? I thought that that was a skill
that was way beyond your limited mental capacity. You probably couldn't even
write a delay loop in BASIC! If you actually do have such a program, you must
have copied my "MAIL PROGRAM THAT'LL KILL SINCLAP" post, and the program in
that post only works on UNIX - and I don't think that you have the ability to
modify it to work on your Macincrap (assuming you actually have one).

>>And one more thing, Sinclap. If Apple is so great and mighty, why did they

Apple had no more to do with the development of the PowerPC chip than IBM had
to do with the development of the 8088! The PowerPC is based on the POWER
chips used in IBM's RS/6000 workstation line and uses the bus of the now-
defunct Motorola 88110 RISC chip. The PowerPC was 90% developed by IBM, 10%
developed by Motorola, and *0%* developed by Apple. Apple's only role is as
the PowerPC's first big customer. And the only reason why they bought into
it is because the 486 kicked the 040's ass and Apple had to do something to
regain a semblance of price-competitiveness with PC's.

Hello!
While I'm saving to buy CUBASE AUDIO, is there a Falcon Sequencer
on any FTP sites any where, I just need something to keep me going. I have
Cubase on my 1040ST but it won't run on the Falcon- 6 bombs!
So can someone help me get it running or can someone help me find a
hold-over sequencer? I really appreciate all the input I've received in
deciding to buy the Falcon, I'm confident it will work out great!

Ah, but he's only the charman, which I assume is like a tea lady only
male, so spelling isn't a great requirement for that job. :)

Whats with all this lame bashing of sad mac/pc individuals? Lets get
back to the real purpose of this group - a forum for Amiga users to bash
ST/Falcon owners.

SO.. how well _is_ the Jaguar doing then?

Well, Gavan, since you asked....
AvP is now in production and looks great!!!! I have been seeing
Jag commericals on during MTV shows. I have also heard that Atari
is advertising during football on the American Fox network.
Atari has also been running ads in the major game mags over here
and all look very slick. There has recently been the press release
from Atari stating that Williams and Atari will work together to
bring Robotron, Joust and Defender to the Jag. Atari has also
stated that 30-50 games will be out by Christmas and that Toys
'R' Us will carry the Jag nationally this year. Also, I believe
that the Jag has been released officially in some parts of Europe
(Sweden anyway).
Ball is in your court, Gavan. How's that CD^32 doing? :-)
And, yes, I appreciate shifting the subject away from PC/Mac, two
platforms that cannot compare to ST/Amiga.

What is Apple's plans with the 680x0-based Macs? Will they
just be dumped?
What is the Alchemy? Is it a PowerPC clone? Also, when will
IBM's PowerPC come out? This I find interesting.
When will the newest upgrade to System 7 come out? Will it give
680x0 Macs the ability to do preemptive multitasking? I am
interested to see how this will work on the Macs.
As far as Atari's plans for the Falcon- I don't know. However,
3rd party developers' plans seem to be to release incredibly
powerful programs at a low price for the Atari :-). Papyrus,
Speedo, NVDI, Magix, Vector Pro, True Image, Neodesk 4....
The software for the Atari is better than the Mac for a lower
price. The Mac has quantity; the Atari has quality.

App will be providing Power PC upgrades. Can the ST be upgraded to the Falcon?

>What is the Alchemy? Is it a PowerPC clone? Also, when will
>IBM's PowerPC come out? This I find interesting.

The Alchemy will be the low end of the upcomming PCI Powermacs arriving on the
scene next spring and summer. Will be housed in a Q630 case.

>When will the newest upgrade to System 7 come out? Will it give
>680x0 Macs the ability to do preemptive multitasking? I am

You mean System 7.5? Already out..

The Software is better than the Mac? In what way? As for price, it's
false..And in most cases there is no Atari equivelants. A Performa 630 system
with monitor, keyboard, fax modem, ClarisWorks, Quicken and other numerous
titles costs $1479. How much for a equivelant Atari setup.

Not sure, tho I've heard of it.

>IBM's PowerPC come out? This I find interesting.

They'll be out, according to IBM, in "early '95". Don't expect
to see them until later that, tho. :-(
When they do come out, tho, they'll kick the PowerMac's ass because
they won't burdened by a pathetic, ridiculously slow, ludricously
resource hungry OS that is *85%* emulated. (Not to mention the
fact that IBM knows how to make computers and Apple doesn't!)

>When will the newest upgrade to System 7 come out? Will it give

I think System 7.5 is out, or will be soon. Consult Peter on this
one. If he is the Mac God that he pretends to be, he should know.

>680x0 Macs the ability to do preemptive multitasking? I am

In our next lifetimes, perhaps. :)

Do you remember Atari's PR statement that 300,000 Jagflops will only be manufactured in all of 94? Hardly setting the world on fire. Sega sold 15 million Genises in the last 4-5(?) years. Atari will be lost in the shuffle. I doubt that there will be 30-50 games available by Christmas...

Sega has purchased forty-million worth of Atari stock and will pay additional in royalty payments for patents held by Atari. Will this be enough to save Atari or will continue the agony before death? What should Atari do with the money? Build more Falcon and get an 040 version out or waste it on the Jagflop?

System 7.5 is not pre-emptive. System 8 will be. However, system 7.5 includes the thread manager which allows app developers to make their applications run in a preemptive manner. But the system software does not now run just any old program preemptively. What the thread manager does is bring in preemptivity slowly so application developers can begin planning for it when it emerges later.

Hmmm, well I asked since there seems to be very little Jaguar
impact here in the UK. It didn't make much of a splash and there
still aren't many games available for it, even a year after launch.
Maybe things are better in the US for it. Its a good system but
looks set to fall prey to the Atari curse.

Incidentally, 3DO looks like it might be a winner here. I've seen
it in the shops and 'Road Rash` was featured on a games TV show the
other night.

> Ball is in your court, Gavan. How's that CD^32 doing? :-)

Actually, its got loads of games (Cannon Fodder, Gunship, Microcosm,
Pinball Dreams, James Pond III, Simon the Sorceror, Banshee et al) and
now has a full Amiga expansion kit allowing you to use the machine as
a full computer. Even though its not currently being made, shops are
still selling stock. Xmas will be a problem if the new owners of C=
can't get machines out.

> And, yes, I appreciate shifting the subject away from PC/Mac, two
> platforms that cannot compare to ST/Amiga.

Right, PC and Mac are not in comparable market sectors to Amiga/ST

Really, then the Atari versions of SuperStarDust, Theme Park, Gunship2000,
SimCity2000 and Mortal Kombat must be excellent! Does the Atari version of
PageStream 3 beat the just released Amiga version? How does the Atari version
of the video toaster compare? Whats the Atari version of Mosaic like to use?
How about real 3d, imagine, lightwave on the Atari?

> Besides, Atari has one great advantage over
> Amiga: Atari is still in business!

They're still manufacturing Falcons? I thought Atari had given up
making computers to concentrate on the Jaguar. They said if they made big
money on the Jag they'd go back to making computers again with the
profits.

Subject: Suggested Stratagy For Atari
Newsgroups: comp.sys.atari.advocacy
Summary:
Keywords:

I'd like to see Atari shoot for some new horizions...
Atari does have some good archives of past research laying around, that with a tiny bit of working them up to the current times and beyond could give them some leverage into two very powerful markets. One being virtual reality systems. Perhaps a good place they can gain some immediate ground is in the low end Personal Computer market. There are millions of people out there who would love to have a simple PC, yet don't require anything any more powerful than an ST. Not everyone cares about, and even fewer people need the power and punch of a Pentium or Power PC. The current trend in software is to make it VERY MEMORY, CPU TIME, and HARD DRIVE hungry. Atari proved years back that their systems could do very amazing things with a mere one megabyte of RAM and a CPU that tops out at 8mhz. They got creative and found ways to directly access the memory...bypassing the CPU unless it was absolutly necessary. Of all the machines made to date...it is hard to argue against ATARI being the best at hardware efficency, and laying out a good OS that allows programers to milk that machine for all it's worth with minimal fuss. With all of this in mind...here are some potential strategeys Atari could take to stay alive while they shoot for getting back into real compitition with the big dawgs.

1> Market what you have! The STe could easily be sold at a good profit complete with a monitor and small hard drive for less than $500.00 a pop if produced in large enough quanities. But it must be pushed as a HOME COMPUTER. Stress exactly what the system CAN DO right now... and not what it might to TOMORROW. How many of you ask the car salesman, "Can I upgrade my Grand Am to a Bonniville when I get the money?" Believe me...there is a market for this type of system... people simply have to be offered an opportunity to buy it. In the entire history of the PC wars...no company has ever attempted this "Get what you pay for strategy." They've always made a point to stick in a bug here and there, in hopes of moving tommorows product, be it a new machine, or a $5.00 fix.

2> Assimilate a list of tasks you want the system to perform flawlessly and efficently. Get the word out, "Hey...this is a job you need done, and this is a job this system can do...today...right now." Most people buy a product with these things in mind.
1. What do I need this tool to do?
2. How much money do I have to spend on it?
Would you buy a $16,000.00 Snap Tight tool kit complete with a hydrolic

wrench when all you really need is a $4.00 3/4" socket, a $15.00 hammer, and a few screwdrivers? I didn't think so. Would you buy a 6 car garage for these tools if you only planed to use them on one car? No, I didn't think so. Well...that's what the current PC market is asking you to do. Buy our machine that has more room than you need...and our package deals are going to force you to buy tools you don't need in the form of sloppily written Operating systems and software which are guaranteed to suck up over half of your hard drive space!

3> Worship your dealer There is no better way to move a product than keeping the people who stock your products happy. The best example I can offer for this concept is little company built in a wood shop in Meridian, Mississippi. Peavey Electronics...they haven't always made the BEST of the BEST products throughout their history, and they haven't ever bought multi-million dollar TV spots...but they kept the goods rolling by remaining loyal to their dealers, and assureing them an attractive share of the profits. They keep the tools small and seperate, so that they can fit in almost anyones budget, yet still turn a good profit for the retailers who choose to carry them. The Asian giants laughed so hard at Hartley Peavey, that they fell on their back sides...and just kept funneling their overpriced overkill products (with no choices per budget on options) through the pennys per sale warehouse market. Peavey still remains loyal to their dealers to this day...and they are now a very successful GIANT in the industry. For this very reason...you will rarely ever walk into a music store that carries Peavey products...and not have unquestioned local support. Furthermore...dealers really PUSH Peavey because they are such a pleasure to deal with...and the balance sheet shows that even with extremely competetive prices...the retailer makes a handsome profit.

4> Refer to point 3>
There are a number of ways to market yourself. The big boys are aimed at high priced media methods. Shooting for 1 in every 5 people who are foolish enough to buy what they don't need...just because a flashy commercial or news article makes them want it. It works well, because they reach billions of people, and they mass distribute via warehouse for pennys per copy.
Someone in Atari's shoes...who has little money for media and mass marketing can still make a very healthy and profitable go for a share of the market, which can rapidly grow into big time contenters.
Atari can not afford to pertend it is IBM or Apple...and snub off small buissness as a distribution method. For peanuts, on the corprate scale, Atari can send out reps and sell their ideas on the local level by winning the love and support of small and medium retail dealers. Next, they should keep constant communication with these dealers...waiting on them hand and foot...helping them advertise localy...person to person...mouth to ear. They should go out of their way to help these dealers train technicians for quality in house support...and do everything in their power to help fatten the wallets of these dealers.
If you were in the market for a new PC...
And there was a place nearby where you could go to take a few systems

for a test drive. I'm almost positive you'd do it!
If you liked what you saw...
and the dealer had a reputation for prompt and quality service...
I'm pretty confident you'd look no further...and give the local guy...
who will soon become a personal correspondant and friend, your buissness.
If that weren't enough...upon seeing his price is just right for your
budget, and the tool will get the job done quickly and efficently...
I'm pretty sure you'd buy it then.
Still not sold? This guy sponsers your son's little league team as well...
I've yet to see BIG BLUE directly affect many communities unlesthere
happened to be a plant in town.
This ancient, but almost forgotten approach to good buissness not only
puts desperately needed dollars in the accounts of a dwindling corperation,
it also puts a number of "Be You Own Boss" type of jobs out in the economy.
It opens the arena for Enterpenures that aren't on Atari's pay roll...
technicians that aren't on their pay roll...
Advertiseing not on Atari's books...
Risks bared by the nation at large...
And a strategy that's been tried and proven time and time again.

5> Try as they may...Mass Media will never outsell the efforts of hard
working individuals...people...people trying to make a good honest go
in life...with the courage to risk a little on the line of a trusted
profit source. Atari could become one of these sources...people would
buy it! And people would benifit from it!

For those of you who have forgotten...
Atari once held many of these notions dear to heart.
I can remember when there was an atari machine of some sort in every other
house on the block, and dealerships of all shapes and sizes scattered in
towns and cities of very diverse natures. I also remember dealers who were
proud to be associated with Atari...and enthuastic about showing you what
the machines could do...and even more enthused to sell you one. Then one
day...they all took down the Atari Signs from their windows...and sighed in
disguest as they said, "It was a wonderful machine...and I loved selling them,
but Atari refuses to keep me stocked to potential." I once even heard an
Ex-Atari dealer say, "I'm selling them as fast as they'll ship them to me,
but I can't continue to deal with them any longer when they refuse to answer
my Faxes, Letters, and questions about technical problems...my coustomers
deserve better than this...and if it means going to less effiecent and more
expensive machines...then I will." The list goes on...and I've even seen
some of the snide reports that Atari would eventualy send in response when
dealers would simply ask, "Why?" They also managed to alienate some of the
industry's finest engineers and designers...and turn down scores of brilliant
programers who simply asked for an affordable development kit for independent
enterprise. The list of disappointments goes on and on...and progressively
worse. You've made your mistakes Atari...it's time to get back to the basics
and win back your most valuable asset...people. You've got highly marketable
products...and potential to someday make another day-view on the innovative
scene...but it's a long hard haul...and it's got to start all over...from
the ground up. The way I see it...Atari's relationships with people should

be top priority for now...as that is the least expensive to begin altering, and the most benifical in the long run. As much as I love my Atari STe... I must admit...Atari has no buissness seeking top minds and developing top notch machines until they learn to manage what they already have.
I wish them luck...
And I'll stand by my Atari STe tooth and nail until the day it refuses to complete a task I need done...and when that day comes...unless Atari has at least tried to work up to it's potential...I'm afraid I'll be buying a Mac or PC. From there...the decision will be mostly influenced by the demonstrations I recieve of both the machine, and the proven service of a local dealer. The first guy that shows me a machine that impresses me, does what I want it to do on demand, and gives me the best support and price, thats what I'll buy...and who I'll buy it from. I really don't care who makes it, and what gadgets the tech heads argue is the best...when I walk in the store, I'm ready to buy...not waste time shoping my valuable work and leisure time away. That's how I was sold my ST...and that's how I'll be sold my next computer. By a person...not a 5,000 page book of ad's...not a TV commercial, and most definately, not a colour flyer boasting a neatly packaged system thru Amercian Express.

Hi Peter,

first you should learn where the 'Return' key is... Oh sorry maybe your nice
Mac soft should do that for you.

I dont think Sega is that stupid to waste that money on a dead horse...
more likely they will have more influence on the Jag, or they will
participate on the big selling Jag...

Bye Wolfgang

News>
rec.games.video.atari article 21351 of [17474,21360] (3252
unseen)

Atari Corp. Chief Executive officer Sam
Tramiel said Wednesday the company expects to sell more than
200,000 of its Jaguar video game machines this year, compared
with a target of 300,000.
Tramiel said sales so far of 90,000 Jaguar units have been
''a little behind our targets'' due to a lack of available
software titles. But he said more than 30 different Jaguar games
would be on sale by Christmas, up from seven currently.
Initially the company had projected it could sell up to
500,000 Jaguar machines.
Atari stock rose $1.875 to $7.50 on the Nasdaq.

As you know, there is no Atari version of PageStream 3. I suspect there never will be. The main reason for this, according to SoftLogik, is that they didn't sell many copies of PageStream 2. That is not surprising, given that, in the ATARI market, they actually had competition from BETTER dtp products, unlike the Amiga version.

>...of the video toaster compare?...
Most of your other points are fair enough, though. But you didn't mention the music market, funnily enough. Where's the Amiga version of Cubase?

>They're still manufacturing Falcons?
Yes. And they did another batch of TTs recently too.

Gavan,
It is pretty silly to pick specific Amiga programs and say,
"Hah! Can your Atari do that?!" For example, how does
Calamus run on your machine? How is Neodesk? How is
Chroma-24? A thread of platform-specific software could
go on for quite awhile. But, I would like to say that
the rendering, image manipulation software for the Atari
has been improving by leaps and bounds! Check out a
recent copy of ST Format or ST Review. DAS Vector,
Chagall, True Image, Chroma-24 and more that I cannot
think of right now. I can get a list for you if you'd
like to check them out :-).
As far as games, the PD/SW scene is great. There are also
some commercial Falcon-only games coming.
Yes, the Amiga has a Toaster.... however, how many home users
need the Video Toaster?! Amiga users always use arguments
such as this that does not apply to many personal computer
users.

Why would Sega pump money into a competitor? Esp. sinc they have the Saturn
on the way. You really are deluded SinFlop - are you trying to post false
'good' Atari news to make up for all the crap you posted?

Thirty games by Christmas and an installed base of 200,000+ users equals success in 1995 IMO. Atari will be pretty hard to unseat if Sega does, indeed, release a game system with a $300+ price tag (the Saturn). By the time Nintendo comes out with Ultra 64 I think that the Jag will be a major player.

Right, so the Atari market is awash with high-end DTP software then?
I think the reason for poor sales is more likely piracy and or low ST
software interest generally

> the music market, funnily enough. Where's the Amiga version of Cubase?

True, the Amiga is weak on midi music software. But then the Atari midi
market seems largely to have defected to the Mac too..
I suppose an Emplant or AMax user could always run the Mac version if
they wanted.

Gavan,
The Atari market may not be "awash" with DTP programs.
However, most users agree that Calamus is superior to
Pagestream. Therefore, it sells more copies than Pagestream.
I think it is simple to see that. DMC, US distributers of
Calamus, are still strongly supporting the Atari. As far
as other Atari DTP programs, there is Fleet Street, Timeworks
Publisher 2 and DAS Layout. What about the Amiga? Is the
Amiga market awash with DTP programs? What is Pagestream's
main competitor in the DTP market?
BTW, Atari Pagestream accounted for 20% of Soft-Logik's Pagestream
sales according to an interview with them in 1991. Since that
time, due to lack of support, I am sure Calamus has eaten into
this.

By your difinition of success than 3do is a major player in the market with already 200,000 plus sold already versus 90,000 for the Jagflop. Yes 3do was out three months early, but 3do has leaped pass Atari.

Thats surprising since sales are near zero. What are the prices for the Falcon
and TT. I remember when Sam T said that the TT would overwhelm the Mac..

>'good' Atari news to make up for all the crap you posted?

Sega "pumped" money into a competitor because Sega essentially lost a
lawsuit by Atari and this is how they settled it out of court. $50 million
in cash and $40 million in stock. Sega gets to keep using the patents that
they were previously using but not paying for in the past. Atari gets
$90 mil - not a bad chunk of change!

Pro Page is the main Pagestream competitor. I tihnk its on version
4 at the minute. Theres also a host of also rans like Saxon Publisher
Pagesetter which are good, but not supported like the major two.

There are a LOT more specific Amiga programs than Atari programs.
I'm pointing out that as a competing platform , the Amiga has more
and better software.

> For example, how does
> Calamus run on your machine? How is Neodesk? How is
> Chroma-24? A thread of platform-specific software could
> go on for quite awhile.

Not on the Atari ;-)

> But, I would like to say that
> the rendering, image manipulation software for the Atari
> has been improving by leaps and bounds!

Good, it needs to! Software like Adpro, ImageMaster and ImageFX have
established the Amiga as a powerful, professional image manipulation
platform.

> As far as games, the PD/SW scene is great. There are also
> some commercial Falcon-only games coming.

Where are the PD Gunship 2000s? Or Theme Parks? Or SimCity 2000s?
PD can be good, but it can't compare to good quality comercial
releases. Plus, the majority of new Amiga software now supports AGA
Amigas directly, theres virtually nothing that uses the Falcons
capabilities gameswise.

> Yes, the Amiga has a Toaster.... however, how many home users
> need the Video Toaster?! Amiga users always use arguments
> such as this that does not apply to many personal computer
> users.

The original poster claimed the Atari could do anything better than
the Amiga could do. I simply cited a few hardware/software products that
the Atari couldn't match.

This was all said LAST year about THIS year. That Atari was going
to capture the market etc etc. It just hasn't happened and there is
NO sign of any major boost in the Jaguar market profile.

Those thirty games were promised long before this Christmas. About
Christmas last year Jag advocates were raving about Aliens vs Predator
being available in mid April. Things like '60 games in development' for
1994 were bandied about around then too.

I never said that 3DO was not a major player, did I? I
think that it is very possible that the 3DO and the Jag
will be the leading systems. The 3DO has the advantage
of having some great games and the Jag has the advantage
of being the lowest priced next generation console for
awhile (with the exception of the 32X). When the games come
out (if they come out), the Jag will overtake the 3DO (IMO).

The 4/85 Falcon is $1299. The TT from Toad is listed in the range of $1200-$1500 (depending on configuration). A four meg STE is listed at $499 (where can I get a Mac that will run most new software for this price?). A home user can get a really nice starter computer for a very low price in the Atari market. The same cannot be said for the Mac (unless you want to compare a Classic to the STE).

I am a long time Atari owner (Pong, 2600, 7600, 800, Mega II ST).

I've heard all the rumors of Atari's going to be great, just give it a little time....

But every time, nothing...

I saw an Atari TT -- at a computer shop once, but only once. It was supposed to be the workstation of the future! Well? Until reading the Usenet, I had never heard of it again.

Atari Lynx, in theory, should have kicked butt over the Game Boy, being in color and having (if I remember) superior (?) graphics. Then how come Game Boy seems so popular. Am I wrong about this?

Back when I had the 800, I used to get into all these arguments over Atari vs Commodore, Atari vs Apple, Atari vs You-name-em. But the fact was, when you went to a computer store, where was the Atari software? It was at Toys-R-Us and Federated! (Federated then went out of business.) Jack Trammel's "Power without the price" was a neat idea, but I suppose it also was "Power without the support from either us or software companies." It's no fun to have the most powerful computer if there's no support.

Well, I see there is a bunch of support over the network, but if you go to a local computer store around here, they speak only Mac and PC. I figured out a couple years ago to go with the flow. Who cares which is more powerful or better? Go with what more people use. It'll always be better supported in the long run.

Just wondering if I'm the only one out here who thinks this way. But boy, it was discouraging that the only Atari shop around was 30 miles away, and it was such a small store. After a couple months, it too had come to pass.

I'm impressed that people are still buying Ataris, but wondering what the main reason people still buy them for when there's other computers out on the market that can do (almost) everything an Atari can do? Mine was the built-in Midi port and the associated price tag. And for that, it's worked out ok. I do nothing but Midi and telecom with my ST.

Well, all I deal with at work is computers, so I have very little need of owning my own computer. Silicon Graphics workstations are a lot of fun. But at home, I've got my ST still hooked up with some Midi application in the disk drive, ready to go.

Oh well, interested in the feedback.

Gavan,
There is no way that I can prove that the Atari is better than
the Amiga in all things because it is certainly not. Both
systems have their advantages.
I still hold by my claim that game and general software support
for the Atari Falcon is good. The Amiga does have more support.
However, IMO, the Falcon has the advantages of a better
desktop (I do not like WB, sorry), better DTP (Calamus as well
as a good selection of low-end programs), and better music.
The Amiga is best, IMO, for video and games. As far as more
general uses like word processing and spreadsheets both have
fine tools (I personally like AW a lot). But, heck, an Atari
130XE can handle these tasks fine.
I hope that you weren't thinking that I was taking the position
of Atari Falcons being the best machine for everything. Only
a rabid Mac fan would claim such a thing :-).
Check out such products for the Falcon as Videomaster, DA's Vector
Professional, True Image, Magix, Chroma 24, and Speedo GDOS for
examples of what today's Atari programs can do.

you know i don't read this newsgroup for 8+ months and I log back on..
what is it.. the SAME OLD CRAP!

Sinclap: get a life and do something about that virginity. You've obviously
got serious problems if you're still up to your trivial nonsense. You
remind me of some nerdy junior high student who goes to over to Atari
Elementary to show off and bully the other kids. It's obvious that
Atari is negligable and Mac is powerful, so who cares? you're just doing
this for some sort of weird, nerdy ego trip, and frankly it's annoying.

The rest of you all: I tried hard to hang on to atari, but it's just
not happening. remember last year everyone was saying how atari was
going to dominate the market, sell a half million machines or whatever
by LAST christmas, how Aliens vs. Predator was going to rule everything,
uhhh, sorry almost all of the jag's (what is it? six or seven?) games totally
suck, and even though the system is widely available there is no damn
software for it.

Right now, the action is in the PC/Mac worlds. It's certainly not our
choice but that's the way it is. I used Ataris and Amigas for many years
(owned both!) and the nostalgia makes me want to hang on to both of
them, but it's not 1988 anymore.. "I got to keep on.." -Curve

peace out..

Does the four meg STE include a Harddrive for the price? New IISI's and used
IISI with scads of memory and HD can be had for $500. Nice Starter system
would cost as much as a Performa 475 which includes monitor and software. The
STE is a 8 mhz 68000 and it costs to much at the price. Nice try

The problem with the Amigo is that you play games on it. When you get sick of the games you sell the machine cause it's dead. But with Atari you will still be able to do usefull stuff on it with the load of application software still being released for it. Yes I would love to sit there wrighting an artical for the user group news letter on an Amigo with the screen flickering away drawing my eyes out of my head, NOT!!!! Give me an Atari mono screen for serious work anytime.

GAMES WILL NOT KEEP YOU GOING FOREVER but then you know that, Amigo went broke didn't they.

What are the specs on the IIsi? You'll need a fast processor to make up for that nice OS of yours. BTW, the STE is a brand new machine. It is not used. Used STEs can be found for less I am sure. So nice try. Find a new Mac that a thrifty family can buy for low cost and run most of today's software.

Gavin you just don't get it do you. I'll explain, Commodore went into liquidation. Now they don't make anything annymore. So soon the software manufacturers will stop making software for it. You must expect those that had programms in the works or completed when Amigo died to publish them and get back some money for their efforts. But that will not last forever.

Some computers do not fade away they just die.

>Seeyoulatermate.

The Jagflop has been a market failure. According to Atari, 1994 sales are expected to be 200,000 down from 500,000. I think the consumers have wised up and will not take a chance on the Atar-Tramiels again.. I would not. As for the Amiga being dead, that is upto the Courts to decide. The ST market is is near zero, so I would not brag about the Amiga.

The IISI came on the market in 1990 as Apple's first low cost Mac. Has a 030
and single Nubus and or PDS slot depending on adaptor. New and used ones can
be found for as low as $400. The STE does not come with a harddrive and
monitor. Add the cost for those items, than the cost is about the same as a
Performa 475 system. Apple is not having any problems of selling performas to
the home. According to MacLeak, performas are in short supply due to high
demand. Even the Local WalMart is out of stock og the Performa 550. How many
STE's did Atari sell this year?

In there with software like Scala/Infochannel, Mediapoint, CanDo.

There isn't exactly a lot of multimedia software out there for the Falcon,
is there?

If you want TRUE MPEG playback, ie 25fps fullscreen with sound, you have
no options on the Falcon (impressive though 21fps is).
On the Amiga - there are a couple of proper MPEG cards available.

Actually, the STE can be hooked up to a television. Monitor
problem solved. But, you can get Atari monitors for $100
easily. And you do not need a hard drive for the STE. It runs
just fine without one, thank you. I should know- I used a
1 meg STE without a hard drive for a year. It was just fine.
The point is- if a family wishes to word process and play games
for a low price you would have a tough time doing so with a
Mac. With a 1 meg STE, a family can be computing for $300 or
so. BTW, I listed a source for the STE. Where I can I get
your wonderful IIsi for $400? And what is the configuration?

Same goes for Amiga - Macs may have power per pound but you still
have to spend 1000 pounds/dollars plus to get any sort of machine.
An A1200 does the job for very little dosh.

Gavan, to be honest, I'd better not argue this topic if I only had the weak knowledge of computer history you have, like, flaming the Atari 8bit series (the predecessors of the C= Amiga series) for having 'only a resolution of 320x192'...sheesh...

* Disclaimer: I'm not the author of this message. Please, DO NOT
* REPLY to me by e-mail and ask for further details.
* (This message was found from a local BBS.)

Warning! Bill Gates (the president of the Microsoft
corporation, USA) may be the next antichrist:

* Revelation 13:18 says:
*
* Here is wisdom. Let him who has understanding calculate the
* number of the beast, for it is the number of a man: His
* number is 666.

The real name of the Bill Gates is William Henry Gates III.
Nowadays he is known as Bill Gates (III), where "III" means
the order of third (3rd.)

By converting the letters of his name to the ASCII-values
(which are used in computers) you will get the following:

B I L L G A T E S 3

66 + 73 + 76 + 76 + 71 + 65 + 84 + 69 + 83 + 3 = 666
"""
* Daniel 7:23 says:
*
* "Thus he said:
* 'The fourth beast shall be
* A fourth kingdom on Earth,
* Which shall be different from all other kingdoms,
* And shall devour the whole Earth,
* Trample it and break it in pieces.

Current history knows three antichrists:
- Adolf Hitler
- Joseph Stalin
- The Pope

(You can count number 666 from each of the names above.)

Is the fourth beast Microsoft corporation which represents
the power of money?

* Revelation 13:16 and 13:18 says:
*
```

```
* He causes all, both small and great, rich and poor, free and
* slave, to receive a mark on their right hand or on their
* foreheads.
*
* and that no one may buy or sell except one who has the mark or
* the name of the beast, or the number of his name.
```

Actually, the ASCII code for "3" is 51, rendering Bill's numeric value
714. This places him, at best, as only a neighbor of the beast. He'd be
on the same side of the street, though, for what that's worth.

Actually, I owned an Atari 400 and two 800XLs and still have one. Its an
excellent machine and I've never flamed it. You must be thinking of someone
else. One of the reasons I bought an Amiga was because it was the natural
successor to the 800XL series.

I don't know. Probably the MAC version is the most up to date now anyway.

> >Whats the Atari version of Mosaic like to use?

> Look on the forthcoming Amiga version for Linux 68k, it's all the same,
> since Linux is a parallel development. Not that much a difference between
> both machines...:-).

No Mosaic? What a terrifically up to date machine you have! If the Falcon is
still viable, how come there isn't the standard net-browsing tool for it?

> >How about real 3d, imagine, lightwave on the Atari?

> Hey, we had this one already. It's the sam niche as the video toaster where
> these programs belong into.

A fairly sizeable niche. 3D rendering is a somewhat more mainstream market
niche than midi music for most users. Not that the ST line is the top midi
machine any more, the Mac having captured that market.

> > They're still manufacturing Falcons?

> Yes, they do.

On demand perhaps?. That should be about five a month then.

Sorry, I was basing my comments on a press release from atari which said
they had basically written off their computer stock and would be concentrating
of making and selling the Jaguar with an eye to using the profits to maybe
carry out some r&d and marketting for their computers. Since Atari isn't
going to be profitable this year it could be quite some time before they
look at their computer line again.

Sadly Atari is now rolling in money - SEGA just bought $40 million worth
of shares, and are paying another $50 million in royalties...

At last! Sense! Though anarchy definitely has it's advantages, 'tis always nice to see apples compared to apples, oranges to oranges, or, if you're going to compare the two, realize that there are certain qualities of one that are not present in the other.

Amigas are great low-cost video machines. Many television stations use them for this purpose expressly. The graphics may not be as snazzy as an SGI or other high-end workstation, but they are more than adequate for NTSC.

Ataris are great low-cost audio machines. Many recording studios use them for this purpose expressly (I know I do). There is a lot of MIDI software available for them, and the Falcon can do digital audio, though not as well as a high-end audio workstation (like a Mac AV with AudioMedia card).

As for games, I had an Amiga back in 1989 and agree -- some of the games available for it are really cool, but for the most part, the same game on the Atari and Amiga looked pretty much the same i.e. all the Psygnosis games i've seen, Starglider I and II, etc.

The author wrote that you must convert the letters. Three (roman III)
is a numeric value already.

I have read somewhere that if you assign numbers to the English
alphabet of the name "Hitler", where A=100, B=101, C=102, etc,
the name equals to 666. (I don't know how to count 666 of the words
"Stalin" or "The Pope," but sure there are many ways to do it..:)

(I don't remember exactly why the number 100 was the number of
the Hitler, but it had a logical explanation. He was in the lead for
100 days or something.)

But, if the ASCII values of the most known computer guy Bill Gates
sum to 666, we should think twice when using Microsoft programs..:)

Check out games like SuperStarDust (or even the original Stardust)
or Putty Squad , Or Alien Breed 2 AGA, or Project X. No Atari game
even comes close to these. Then there are the hordes of games that
the Atari _could_ do but will most likely never see due to low
sales - games like Desert/Jungle Strike, FIFA Soccer, Gunship 2000,
Theme Park, the Settlers, UFO Enemy Unknown, Indy 500, TFX, Cannon
Fodder 2 etc.

I don't think you could say the Atari even comes _close_ for
games these days, but in the days of olde games like Carrier Command,
Stunt Car Racer, Dungeon Master, Starglider were every bit as good
on the ST (in some cases, better) as they were on the Amiga.

Atari will capture the market. I am a Genesis owner, but I see this as inevitable already. The Jaguar price is coming down. I have seen it for $212, and will not be surprised to see if for $199 or less at a lot of places by Christmas. By later next year, it will be down to $149, and at least 30 or 40 games will be out. I just wish that they would do "Wizard of Wor" on the Jaguar. Or, maybe they could do a 3-d version.

Maybe because Atari is in a totally different class, with a 64-bit
machine. Sega is going with a 32-bit machine. That really puts them in
different nichs. The Atari, for example, will be able to take an MPEG
board, and could work quite well as a video disk (movie) player. The Saturn
would have some major problems with this.

Whoops, I hadn't read that. My mistake...

However, according to the rules of naming people "Junior" (i.e., Ned Flanders, Ned Flanders Jr., Ned Flanders III), one's name gets bumped up a grade when the next man up dies. (This is why you don't see preppies with names like Winston Throckmorton XIV -- only royalty and popes can do that.) Therefore, this thing will only work until Bill's grandfather passes on.

I think these rules are detailed further in Miss Manner's Guide To Excruciatingly Correct Behavior, or perhaps The Preppie's Guide To Life, if anyone really wants to push the point.

>
>But every time, nothing...

Lack of marketing (and support) is the major problem with Atari. I
think everyone agrees with this. Atari Corp is a good example on
not how to run a company.

>I saw an Atari TT -- at a computer shop once, but only once. It was
>supposed to be the workstation of the future! Well? Until reading the Usenet,
>I had never heard of it again.

Atari's stay-behind-the-times-technology did not help. When the TT
came out, it's hardware capabilities were not special, it was over-due,
and it was overpriced. What are the current prices for a TT based
system nowadays?

>Atari Lynx, in theory, should have kicked butt over the Game Boy, being in
>color and having (if I remember) superior (?) graphics. Then how come Game
>Boy seems so popular. Am I wrong about this?

Poor marketing killed the Lynx. It seems Atari is willing to put the
technology in there gaming systems and not into their computers. From
my observation, Atari must be completely bumped out the market before
they put resources into development. Atari used to be king of the
gaming market. Why wait until now to come out with new gaming systems
(eg Jaguar)? Now that Atari is practically non-existent in the
personal computer market, I figure they'll come up out with a real
state-of-the-art computer to try to recapture the market ;^)

>Back when I had the 800, I used to get into all these arguments over Atari vs
>Commodore, Atari vs Apple, Atari vs You-name-em. But the fact was, when you

>"Power without the price" was a neat idea, but I suppose it also was "Power
>without the support from either us or software companies." It's no fun to
>have the most powerful computer if there's no support.

"Power without the price" is no longer true for Atari computers. If
they want to stay in the personal computer industry, they'll need to
lower prices. Hey, maybe they don't care about the pc market anymore.

>I'm impressed that people are still buying Ataris, but wondering what the main
>reason people still buy them for when there's other computers out on the market
>that can do (almost) everything an Atari can do? Mine was the built-in Midi
>port and the associated price tag. And for that, it's worked out ok. I do
>nothing but Midi and telecom with my ST.

I shopped around in the PC market over a year ago, thinking it is about time I leave Atari and go to "faster", "more choice" PCs. Yes, PCs are faster and you have more choices when talking about hardware. I dislike Windows and MS-DOS, but every damn PC you buy, that's what you get (some choice). I do not enjoy an archaic OS that is not suited for the hardware it runs on. I had my fun playing with memory managers and .ini files to keep me from buying a PC with Windoze/MS-DOG (plus I dislike the Windblow interface).

I looked at OS/2. It's better, but I think it needs a little more work. Improvements in OS/2 could convince me to move over to a PC.

I think people still buy Atari because they like the software, and existing Atari users would like to keep their software investment. People can argue all they want, but there is some neat software for the Atari. I have different choices on the types of shell interfaces I use (windowing, CLI) and multi-tasking environments (that do not eat up tons of disk space), and I have yet to see a PC/Mac telecomm program out-perform Uniterm. Hopefully, the hardware for Atari will get out of the stone-age, and be affordable to the average consumer. Luckily, I have not had conditions that required me to move over to the PC/Mac world.

What should Atari do with the money? Build more Falcon|> and get
an 040 version out or waste it on the Jagflop?
|>
|> -Peter

The Jagflop as you call it is the most potential profitable
part of ATARI right now. Maybe you meant FalconFlop.

Hi to all again. Info from the Jaguar mailing list says:

* The Jaguar has sold 90,000 units up to date (*OFFICIAL* ATARI info)

This isn't very good but:

Sega: is giving a total of $90 millon bucks to ATARI.

$40 million in shares + $50 million for overdue-payments on royalties
for ATARI patents (about 70 ATARI patents).

Answering the question of whether this would save ATARI or not:

* If ATARI uses the money well, and the Jaguar gets at least
4 very decent games, I'll say they'll sell enough systems
and thous will be saved.

* If ATARI manages to build enough Jaguar to supply demand, they
will be saved.

* If ATARI doesn't sell enough Jaguar this christmas... then
they will be where C= was last April.

Pete,
Unless you're some kind of mutant (something I am not entirely
ruling out) then the number of STEs sold last year far exceeded
the number of fingers you have. In fact, I would say that the
STE probably is Atari's most popular computer right now.
Toad is selling an STE with color monitor and software for
a little over $400. Everything a family needs to get going.
Also, Computer STudio just got a new shipment of STEs and STacys
in. I am not being technical when I say that the STE does not
need a hard drive. You can run great software for it from the
disk drive because the software and OS isn't bloated like it
is for another platform I know of. You may argue that it is
not as feature rich but.... so what!! We're discussing a
start-up computer not a machine to be used by a professional.
Funny you didn't tell me where I can get that wonderful Mac
of yours. I have given you two sources for the STE. Two
well-established dealers I might add.

Was it the basic color or the color plus display? Your friend should have tried out the monitor before purchasing it. The Apple color trinitron is crystal clear. However, here are plenty of third party ones such as the $379 street Magnavox 15' multiscan and so on. You should not use that crappy Apple monitor as a basis or poor reflection on the LCIII.

Atari just announced that Jagflop production for 1994 will be 200,000 down from 300,000 down from 500,000. So how are these numbers capture the market? It's the same old bullshit from Atari. While the Jagflop may come down in price, 3do price has hit $299 and has sold over 200,000 as of August.

Don't even think of comparing the STE and Mac Two series, How much memory
do you need to run Sytem 7 and what left from the 4 M of RAM. On the
contrary, the ATARI OS is in ROM, no need to use any RAM. Most of the
software that a person would need as a starter would run from the floppy
with no problem. Most of the common program on the ATARI need the most is
1M, you cannot say so for the Mac. At work I have 64M of RAM on a Quadra
840 and I am still run out of memory sometime.

So long

:
: Me? I wont by a Pentium, I am holding out for the Leroy chip!

Actually, you may already be in trouble... 486-66 (note those last 3 digits). Likewise for the Pentium (hmm...penta, penta-gram) aka 586-66.

Personally, I've always been more than a little curious as to why 66 MHz ended up being the 'magic' number.

The number actually pops up a lot more often than people realize...ever wonder why many of your computer processed statements have 696 (not necessarily right next to each other)? ...yes, it's six, nine, six and that's no coincidence with arabic numerals...

On another note, I was writing a program many years ago on a computer (TI-99/4A) redefining characters and stuff for a game. Anyway, whenever the game ended (or I 'escaped' from it) the characters would revert to their original assignments. Imagine my horror when I noticed that the three characters in the EXACT center of the screen reverted to '666'! After changing my underwear (and the character assignment) I took that little experience as an omen (whatever you want to call it) to be leery of the future use and abuse of computers and computer technology.

As for Mr. Gates, maybe, maybe not (I'd hate to be 'fingered' as the antichrist just for being successful)...the main point is to be vigilant regarding the issue as a whole and to consider that some way, some how the computer will probably play a role. Every time you stuff your ATM card into a machine, or use your credit card, someone somewhere can _immediately_ identify you, your location, the date/time, amount, and type of purchase, etc...even the Internet itself could be an incarnate.

There are (according to the Bible) many antichrists, but there shall be one who attempts to gain supreme control.

Many schemes can be employed to 'calculate' the number of a name...e.g. a man of great power who deceived many people, Ronald Wilson Reagan (The "great communicator"), was calculated to be '666'.

The Pope? Hmmm, fatal wound to the head and a quick recovery, head of a very powerful and large _organized religion_ (not a good thing according

to the Bible)...it's all open for debate.

No mortal will ever know the truth about those situations.

The fact is, the list is long and very questionable. Your job is to be aware of that one person who will try to trick you and everyone else in the 'big show'.

"And the many were deceived."

God's speed and good luck.

Scott D. Ellingsen

: Really, then the Atari versions of SuperStarDust, Theme Park, Gunship2000,
: SimCity2000 and Mortal Kombat must be excellent! Does the Atari version of

Games, games games... who gives a shit? Sure I enjoy playing them
sometimes but I don't rate my computers performance over them. My Falcon
has enough games for me to while away a few mins when I feel the need.

: PageStream 3 beat the just released Amiga version? How does the Atari version
: of the video toaster compare? Whats the Atari version of Mosaic like to use?
: How about real 3d, imagine, lightwave on the Atari?

PageStream 3... who needs it when you've got Calamus SL ?? Or how about
Papyrus Gold - that's an awesome package, bar none. Video Toaster? The
Titan Genlock and Animate software can do adaquate video titling, but if
you are serious about vt then you'd already own an Amiga so it's kind of
a null argument. Mosaic? Now that I would like to see on the Atari.
Raytracing - Xenomorph 2, CyberStudio, RayStart - they all do the job
well enough and anyone serious about raytracing will use POV 2 on the
Atari which is just as good as the Amiga version.

: > Besides, Atari has one great advantage over
: > Amiga: Atari is still in business!

Amiga are still in business judging by the sales of miggy magazines and
software, but department stores are not stocking miggy's any more, and
software retailers are drasticly cutting down on their stock. PC is the
way forward in these guys minds (sad huh?)

: They're still manufacturing Falcons? I thought Atari had given up
: making computers to concentrate on the Jaguar. They said if they made big
: money on the Jag they'd go back to making computers again with the
: profits.

You can buy a Falcon for 300 UK pounds now, that's same as a A1200 but
with a better spec. They probably arn't manufacturing any more, but at
least there is the distinct possibility they will start again in the NEAR
future. That can't be said for Commodore.

: Check out such products for the Falcon as Videomaster, DA's Vector
: Professional, True Image, Magix, Chroma 24, and Speedo GDOS for
: examples of what today's Atari programs can do.

Yeah, don't forget the new APEX MEDIA software which is available in a few weeks time, 24-bit real time true colour digitising and the most advanced graphics software on any home computer - see it and understand why I make that claim. Also can Amiga's run MPEG animations at 12-13 frames per second in colour? My Falcon can. Or how about running FLI/FLC animations? Yep I can do those too. And how about 50kHz sound tracker with 32 channels in stereo. Easy peasy for me. And I have plenty of 10 channel mods to support that fact. I can also play S3M mods from the PC and have some astounding D2D software. Let's face it, the Falcon can kick ass and no-one can prove me wrong once they see the system and software I have running. JPEG decompression in mere seconds, GIF display instantly, convert/play every sound sample format possible (inc PC, Unix and more). Hey I even have a high density disk drive and SVGA monitor with superb resolution that doesn't make my eyes bleed.

Check the facts.
Check the reality.
Don't just ASSUME everything.

Old games like Tempest 2000 - I mean that was _so_ badly received in the
press wasn't it? (take the saracasm and swallow deep boyo).

: One of my friends said that the reason for the delay in the
: Jaguar is that it is so difficult to program.. something

That's complete bullshit as ANY Atari/Amiga programmer will tell you.
The chip design and architecture allow a very easy transition from 680x0
to the Jag and development is usually very easy on it.
What is more likely is that the delay is caused by most programming teams
being made up of only 2-3 people who have to work on other machines at
the same time.

And I was talking about FULL SCREEN , 25FPS MPEG WITH SOUND.

If you are happy with software mpeg then you can get players for
most popular platforms. If you want the FULL THING then you still
need a card - even on a Falcon.

Its easy to see we've got a load of net newbies with the Universities
being back.

: color and having (if I remember) superior (?) graphics. Then how come Game
: Boy seems so popular. Am I wrong about this?

I agree with most of your post whole-heartedly, but you have to remember computers/consoles/hand helds are not sold on technical merit alone. You geth the first time impulse buyers who purchase it's the 'next best thing', then you get the ones who may have owned a machine by the same manufactuer before and want to follow the line, then come all the bulk buyers. If you only manage to attract the first two groups you are only ever going to sell a few machines to a minority, no matter how amazing the machine is.

Lynx is far superior to the Game Boy, no one would doubt that, but the software support isn't there. The user base isn't there and when the Lynx was released (eventually) hand helds weren't the 'fad' they had become, the Game Boy soaked up a huge market area and left little space for Atari to nudge into. The Game Boy owners, well sure they had mono graphics and sound, but they had lots of games, all cheap and some very addictive - there was no incentive for them to upgrade to the Lynx at all. Therefore the Lynx only ever hit a small number of people, it became a cult machine - even though it was a far superior to anything else available.

It's all about marketting these days, heck it was all about marketing back in those days too, something Atari has always been slagged for (and unjustly I might add).

Computers are not for techie heads any more... they have becoming far too consumer based, this is what's causing all these factions that spring up.

So you admit that Apple put out a "crappy" monitor? Well,
I've got news for you, Sinclair, you should be able to suspect
that a .39 dot pitch VGA monitor will run like another from
a different company especially if it costs more! My Hyundai
cost less than the Apple brand cheap-os and has a much better
display. I didn't get a chance to try my monitor out before
I bought it because they didn't have any on display. Other
people may be in the same situation. What if they wanted to
order a monitor from your beloved Mac Warehouse? What would
they do then? Not everyone has access to your campus dealer.
You seem to think everyone gets your educational discounts and
such but they don't, thanks.

Atari still sells computers! How do you know what a family needs? Why are the
Peformas popular? According to a recent Wall ST Journal article on the
home/office market, multimedia pc's and Macs are whats driving the market.
Only die hard ataridroids are still interested in the STE- a slow cpu, 2-4 bit
low res color and non expandable to a PowerPC. As for Macs, check out Shrieve
Systems, Mac Sale International, Sun Remarketing, comp.sys.mac.wanted and
misc.forsale.computers.mac...Thats more than two...

All you have to do is look at the spec sheat and or label on the box. The performas have the monitor dpi listed on the box. Anything higher than 28 dpi, avoid. Apple has dumped that crappy monitor and the 28 dpi color plus display is the entry level monitor and is a nice one.

If you order a monitor from MacWrehouse, the monitor's specs are listed in the colorful catalog. The dpi's are listed. Plus macWarehuse, MacConnection and mac Zone have a 30 day MBG...

Scott,

Yes, one our friend bought a Performa, and she is cursing that day now...
And on top of that, Apple wants something like $300 or thereabouts for this
crappy monitor... But then, that's Apple.

Then, of course, Apple's most resounding success was in managing to make an
040-based machine slow as a cow's turd on a cold day. FWIW, PowerMac is quite
slow as well, at least when running 68K software (e.g., Mac OS)

Atari no longer produces ANY computers, they have shifted to Jag and coin-ops.
Any Falcon that you're getting from Atari is unsold stock, not new machines.

I just talked with TOAD, and the TT is still being produced. The reason
is that Atari sells a Jaguar development kit for the TT.

I also got the impression that the Falcons were still manufactured, but
I could be wrong.

My mistake.. The entry level monitor is the .28dp. Apple does not make the
monitors. There new monitors are pretty good. Than again Atari only sells the
low res overpriced monitors. So is Atari committed in comming out with PowerPC
ST's? That would be a major decision in selecting a cpu..

Hmm ... if "NOBODY" bought Atari like you seem to think, Sinfreak
then there wouldn't be any groups like this, would there? Obviously, a
small market (MIDI and DTP) is interested in the Falcon and TT.

For your info, SinDork, the Amiga is a Lynx development system
because the Lynx and the Amiga were designed by the same people. The Lynx
was sold to Atari and the Amiga was sold to Commodore. It's not a
question of preference. And ... the Atari-designed Jaguar uses a TT as
it's development system!

Your average family doesn't even have a computer, twit.

But for those families that do have computers just how many need a powerPC
in order to do word processing and play games?

Lets be honest about this---home users do word processing, play games,
run small databases, and do personal finance.

Very few do 3d rendering, photo retouching, CAD, CAM, realtime modelling of
subatomic events or indeed anything worthy of 68020, let alone the powerPC.

This is all I use mine for as well, but it still does a good job of it.
I've got Omega II (upgraded from Omega I), X-oR, some other MIDI software
like RealTime and Twelve, the Phantom SMPTE interface, etc. I recently
bought a PowerMac but plan on only using it for HD recording and syncing
it to the Atari, at least until I get a big sequencer for the PowerMac and
move all my songs over -- which will take awhile. For now, though, the
ST remains a good MIDI box ...

You say that the Falcon can only display 16,xxx Colors ???
Well, I can tell you thats quite wrong indeed.
The Falcon can display 65536 colors on-screen, it's 16-bit Hi-Color-mode.
The 256.000 mode on the AGA-Amigas is the HAM-8 type of display, which means that it's slow, looks bad when using contrast colors. And the 1280x480 is a bad proportion, when doing serious work. And if you wan't higher line resolution on the Amiga you get that terrible interlaced display - certainly not suited for serious computing.
The Falcon's max.res. is not 640x480, without adding hardware it's about 900x700 using BlowUp030 screen-driver. And with the ScreenWonder Pro (which is VERY cheap) the max. res. is 1024x712 NON-interlaced and 1280x1024 interlaced.
On a TV the max. res. is 768x480 in 65536 colors and a little driver can do 1600x600 in 16 colors on a TV.
Hmmm, so you see I can't really agree on your statement....

Pete,
Atari has always sold high quality monitors. They have always
been right up there with other brands. They do not make VGA
monitors because there is no real point to. There are enough
out there. My feeling is that Apple sells monitors to people
gullible enough to buy a Mac because they figure that they
need to use an Apple monitor with their Apple machine. Apple
monitors just cannot compare to other brands.

Pete,
Your little story about the Lynx's development system reminds
me of the days when Apple employees used Ataris equipped with
Spectres because the ST was a better machine and cost less.
Apples reaction, of course, was restricting Apple ROMs so that
it was harder to find them to emulate the Mac. I love Apple!

[Snip : Long list of *excellent* Amiga games that will never be seen on an Atari]

The *big* difference between Atari and Amiga in 1989 and now is that at that time neither machine dominated it's market. The games publishers just saw two 68000 based machines and wrote games that could be ported to either. As a result they didn't exploit the Amiga's hardware.

Now that Ataris have retired to the world of recording studios and MIDI obsessives the Amiga gets software which *does* exploit it's superior hardware.

Software houses will develop games for the biggest markets, they don't give a shit about the hardware. Ask yourself this question ...

Why develop games for a machine that has no hardware scrolling and no sound as standard ? Answer : Because there are millions of then out there and a market that size *cannot* be ignored

As a result PCs now get the first version of a game and then it gets ported elsewhere.

Despite this the Amiga is still in the best position as far as games are concerned. Strategy games, adventures and flight sims get converted from the PC; arcade games get converted from the consoles and there are still companies like 17 Bit who write original Amiga titles.

The Amiga may be about to die, but there's no heir to it's throne.

How comes that the AMiga doesn't have the standard GUI (i.e. Windows)?
BTW, it wasn't YOU who ported Mosaic to the Amiga, and if the few people
(or was it just one?) who did it hadn't done it, your stupid little soapbox
would just crash under you. And my best guess why noone has yet programmed
an Atari port is because they too much concentrate on getting the GEM
emulator for Linux 68k to work (Is there an AmigaOS emulator in
production?). Or they concentrate on shareware like Graftool or GEM-View,
UPoint or CoNnect and similar projects. BTW, ever tried getting CHEAP,
FAST TCP/IP in Germany? Ever tried browsing through Europe at all? Face it,
WWW is hardly usable over here.

In WHAT cases, Peter? Be precise, please. Have you ever SEEN any of the
above applications and tools?

>A Performa 630 system
>with monitor, keyboard, fax modem, ClarisWorks, Quicken and other numerous
>titles costs $1479. How much for a equivelant Atari setup.

That's the proce of a Pentium system in the US, according to my
information. Buying a closed system like the Mac when one is able to get an
OS/2 platform is ridiculous. Just the price for the cables I'd need would
pump the Performa price up to approx 1700 US$.

Richard,
I will agree that the Amiga has more games coming out for it
exploiting the hardware and that the Amiga has more games
coming out for it in general, but I don't agree with the
blanketing statement that the Amiga has superior hardware
to the ST/Falcon series (if indeed you are including the Falc).
The Amiga was better technically than the ST. However, the ST
was a lot cheaper too. Now the Falcon costs more and is IMO
a better machine than the 1200. If companies wrote more
Falc specific games we'd see what the machine could do.
As it is the demos I have seen for the Falc are amazing as
well as the few Falc specific games I have.

Actually, we use Apple badged Sony Trinitron 16" and 17" multiscans
here and the picture is superb. The prices are quite reasonable too.
The mac sennds a power on/off signal to the monitor so there might be
some hassle in rigging a normal svga to it. I seem to remember seeing that
the rgb signal on the macs doesn't have a sync pulse or something like
that too, so not all monitors will work with it.

But a lot cheaper. You can now whop a 28MHz 030 into an A1200 for 150UKP.
SCSI-II is another 60UKP.

Basically for the price of a 4 meg ~80M HD Falcon you can now have a
6 meg, 28MHz 030, ~80M, SCSI-II Amiga with 882 co-pro. OK, still no
DSP but a 28MHz 030 with 882 is going to be a lot more use generally
than a sparsley supported DSP chip.

> >machine, The A4000 is.. 1280x480 in 256,000 colors out of 16.2 mil!

> Oh yes---the only trick the Amiga is good for.

You can also get a full 256 levels of gray in any rez up to 1280x512.
Quite useful for mono DTP and image processing work.

Quick, get it on the front page of TIME magazine.i

And I didn't come in here pushing pagestream 3.0, it was one of a
list of titles that aint on the Atari.

> a Falcon, or even a PC with a GEMulator ;-)

Beleive me: You did the right decision.

> Would you care to elaborate on exactly what made you change from the Falcon
> to the TT?

- The FALCON is too slow. With those graphics extension like BlowUP the machine gets even slower. And I prefer 1280x960x2 on a nice 19" monitor and I do not need colours.

- The FALCON does not have much RAM. 4 MB isn't a lot if you want to use MultiTOS, MiNT, MiNT-Net and/or gcc. The only RAM upgrade option is to waste *six* MB: Pin your four MB card on the wall and buy the 16 MB card, from which two MB are always unused. After the waste of six MB, you have 0 (*zero*) MB of FastRAM.

- I've seen enough demos. But the demos are the only thing I miss on my TT. But I've recorded all the FALCON demos on video tape before selling it. ;)

- The FALCON has just one useful serial port. The TT has four of them. With my TT I can do a nullmodem connection to my Sun *and* to my UNIX PC. This was impossible with the FALCON (The FALCONs LAN port did not work for me).

- The TT has a keyboard. The "keyboard" of the FALCON is even worse than those of the old 520 ST. And the keyboard is external.

- The TT has space for an internal 3,5" hard disc any height. With the FALCON I had to have an external case for this.

- The TT has an VME bus. So if I one day have too much money, I'll buy one of those ethernet cards and use this rather than SLIP like at the moment.

Now it's your turn. If you want to tell me something about great accelerator cards for the FALCON, please shut up. If you want an overpowered CPU on a tall and slow bus, you should better get an ISA 468DX-2/66. The PCs have learnt late about the bus, but please do not do the same mistake now on the ATARIs. And remember: All the things I mentioned above are *included* in the TT! And my TT with TTM194, 4+4, 48 was *cheaper* than the FALCON I sold with 4 MB RAM, 42 MB IDE,

BlowUP and Multiscan monitor.

Bye,

: No, you should be jealous of the MASSIVE (compared to Atari)
: Amiga user base, the wide software support, the variety of different
: Amiga models and the wealth of hardware Amiga add-ons that have NO
: Atari equivalent.

Should we also be jealous that computer chain stores are also chopping down on their Amiga stock and cutting back VERY much on their hardware range. It will end like Atari - with dealers and mail order companies becoming specialised in that field, users becoming less and less and software production becoming shallow in the games (read-money making) department.

Your massive user base consists of _lots_ of kiddies who have a games machine for which they can pirate from their friends, only a dedicated handful will continue with the Amiga range - as has happened with the Atari - and the average age of Amiga owner will rise. In a recent survey the average age of the Atari owner it came out at something like 30-40 years of age. I would argue that the majority are serious users for which games don't play much role in their computing life. Very soon the Amiga will reach this stage with programmers, demo crews and applications users left. Just look at the editorial style of magazines such as The One for Amiga and you can't help but agree most of their 1000's of readers are teenagers, it is a games magazine, the writing style is very childish an designed to appeal to the younger generation. Amiga shopper on the other hand is a different kettle of fish, and it is the reader area of this magazine who will remain dedicated to Commodore and be the ones still using Amigas in a few years time.

Flame all you like but careful you don't burn yourself.

>
>You say that the Falcon can only display 16,xxx Colors ???
>Well, I can tell you thats quite wrong indeed.
>The Falcon can display 65536 colors on-screen, it's 16-bit Hi-Color-mode.
>The 256.000 mode on the AGA-Amigas is the HAM-8 type of display

Firstly, please do something about your line length. nearly 400 characters
is a BIT excessive. Secondly, HAM8 has a maximum number of displayable
colours ranging from 262144 to 16777216 depending on the base palette,
not 256000.

, which means that it's slow,

Not seen FJpeg, JpegAGA or a full screen, scaled HAM8 mpeg player then?

looks bad when using contrast colors.

Not seen a decently paletted HAM8 picture then? JpegAGA often gets pictures
perfectly represented to within 18 bits, which look better than 15/16 bit
pictures, even when the 15/16 bit picture is error diffused and the HAM 8
picture is not. I know, I have seen the two side by side, using a pair
of rather expensive, high quality multisyncs. This is not just my opinion,
I could find not one person who thought that the 15/16 bit picture looked
better, and whilst a few people (mostly those not used to computer graphics
) said they could see no difference, quite a number of people said the HAM
picture looked better. Turn off error diffusion, and the 15/16 bit picture
quickly falls very far behind, coming only slightly ahead of a cheap and
cheerful HAM6 representation. I have conducted experiments into this, I
KNOW what the two modes look like side by side. You, apparently do not.

And the 1280x480 is a bad proportion, when doing serious work. And

That's 1280*512 thankyou (going upto 1400*600 on some monitors), which is
EXACTLY the same aspect ratio as a standard PC text screen, which millions
of people used, and still do, for quite a lot of serious work, thankyou.

if you wan't higher line resolution on the Amiga you get that terrible
interlaced display - certainly not suited for serious computing.

Again, the facts do not support your statements. At a given bandwidth, an
interlaced display has LESS flicker than a non-interlaced display.
I do most of my work on an 800*600 interlaced display at 81 Hz. This
work involves a large number of hours spent using that display to write
C source. That serious enough for you? Interlaced displays are actually

NEWER technology than non-interlaced displays, and were invented for the
sole purpose of reducing raster flicker. Yours is a sadly common misconception.
Your second error is that the maximum non iterlaced resoloution of the AGA
Amigas (using squareish pixels) is 784*550 (at least using the same version
of the monitor drivers I'm using, V40.something, available for ftp from
src.doc.ic.ac.uk and all other aminet sites.)

>The Falcon's max.res. is not 640x480,

Here we go again with these long lines. It's very annoying having to
re-fromat your post you know.

without adding hardware it's about 900x700 using BlowUp030 screen-driver.
And with the ScreenWonder Pro (which is VERY cheap) the max. res. is

Extra hardware? The Amiga has some rather nice, inexpensive, high resoloution
24 bit graphics cards available. Check out a current Amiga magazine for
details.

1024x712 NON-interlaced and
^^^ So what? See above.

1280x1024 interlaced.
>On a TV the max. res. is 768x480 in 65536 colors and a little driver

A1200 does 1280*512 on a TV in all colour modes.

can do 1600x600 in 16 colors on a TV.
Not if you're using NTSC you can't.

>Hmmm, so you see I can't really agree on your statement....

And I'm afraid yours are rather ill-informed and sparsely populated with
facts.

The A1200 still costs less than a Falcon. The bare A1200 still costs $330(the highest I have seen). Add an inexpeensive GVP accelerator or a MBX boards such as the 50 mhz.030 and you got a nice machine for under a grand. GVP has an 030 running at 50hz, SCSI II and four megs of ram for $599. This card fits in the trap door of the A1200. So you can get a reasonable price A1200 with six megs of ram, 50 mhz 030 and a 500 megHD for about $1300 which is the cost of a Falcon 4/80.

Well, if I'd actually ever been able to FIND a Falcon, I might know, but
seeing as the only one I've _EVER_ seen was at a computer show, I'm at a
slight disadvantage. There isn't an Atari dealer with a few hundred
miles of me (well, there used to be an Atari/Amiga dealer, but he dropped
the Atari just after the STE was introduced - he's still an Amiga dealer,
though). Just goes to show that the Falcon is such a great machine. :)

(And since when has a dongle been any deterrent? They're almost as easy
to defeat as the "Type in a word from the manual" stuff.)

>Weregoose (confusing other people with facts)

Well, that's just plain unfair!

Hmm - how long does it take JpegAGA to transform its internal 24 bit
image into a HAM8 image?!?

>That's 1280*512 thankyou (going upto 1400*600 on some monitors), which is
>EXACTLY the same aspect ratio as a standard PC text screen, which millions
>of people used, and still do, for quite a lot of serious work, thankyou.

And each character of a VGA card is something like 15x9 pixels (maybe 18x9
or something, but far from being 1:1). So why do you try to mix text and
graphics resolutions?!?

>Again, the facts do not support your statements. At a given bandwidth, an
>interlaced display has LESS flicker than a non-interlaced display.

Right. But "at a given bandwidth" is what the original poster attacked.
The bandwidth of the Amiga video subsystem is, well, not the market leader,
to say it nicely.

>I do most of my work on an 800*600 interlaced display at 81 Hz. This
>work involves a large number of hours spent using that display to write
>C source. That serious enough for you?

Which means you get an actual screen refresh rate of 40.5Hz. Which means
that thin horizontal lines flicker at 40.5Hz on your screen, which at
least for me means a serious headache after about an hour.

>Interlaced displays are actually
>NEWER technology than non-interlaced displays, and were invented for the
>sole purpose of reducing raster flicker. Yours is a sadly common misconception.

Ah, well, so who invented non-interlaced displays before television?
Face it, "for a given bandwidth" interlaced displays are better, but given
a resolution interlaced or non-interlaced with the interlaced one showing
X frames/second and the non-interlaced one showing more than X/1.5 frames
per second, you would always go with the latter!

>Your second error is that the maximum non iterlaced resoloution of the AGA

>>On a TV the max. res. is 768x480 in 65536 colors and a little driver

>A1200 does 1280*512 on a TV in all colour modes.

Great. Have you counted those color-triples on your TV lately?

>option..

Need for it ? come on Peter _don't_ tell me you believe apple-talk
<evil grin> thats PR, apple needed to go RISC and they did in a good way
but if you want speed going PowerMac today is a bad option for most of
the people out there for the following reasons:

Powermacs have a REALLY bad memory/bus system, for example the 7100 has a
bus (slots) of 1.2 Mb/sec. The 8100 is a bit better but not that much
(and people where screaming about the 16/32bist thing in the falcon or the
bad memory design of the amiga 4000/40 :-)). At work we are where trying
to get a rasterops card (video) working in a 8100 but had to go back to
a 840av because it was MUCH faster (oke if you thing about 6mb/sec is
fast). Also ask rasterops or avid why they don't use the PM yet !

The current Powermacs will be useless soon, because of for example PCI.

The current Powermacs are SLOWER for most 'normal' things than there '40
bases partners.

>>Lets be honest about this---home users do word processing, play games,

>>
>
>True.. So whats your point?

Maybe for these things a Falcon/ST is good enough ? or maybe they will be
better off getting a non powermac ?

>>Very few do 3d rendering, photo retouching, CAD, CAM, realtime modelling of
>>subatomic events or indeed anything worthy of 68020, let alone the powerPC.

Funny part is for most things today the Powermac is a 68020 (sure there
are 300+ Powermacs apps) but there are many more that are doing 68020
because people don't have the powermac version OR the apps is for normal
macs.

Doesn`t the Falcon still have TOS? I heard that it was awful on the Falcon, and painfully slow. But I haven`t used it myself so I can`t comment too much. Having said that, the A1200 is a bit slow without fast memory.

JpegAGA, starting with a raw 768*512 JPEG image, and ending up with a screen
display takes around 40 seconds. Extracting the 24 bit data from the JPEG
using djpeg (upon which JpegAGA is based) takes just over 20 seconds. Djpeg
does not, of course, have to write to the screen, and so avoids
any bus contention.

Why should I not use that resoloution? If i am doing graphics work for
output to videotape, or something for a demonstartion that needs to
be shown on a television, it makes sense to use the highest resoloution I
can. When drawing graphics,raytracing, etc, the aspect ratio is irrelevant.

And the Falcons is? It's by making efficient use of that bandwidth (such as
HAM, interlaced displays, etc) that the Amiga manages to attain the performance
it deos despite it's modest graphics bandwidth.
>
>>I do most of my work on an 800*600 interlaced display at 81 Hz. This
>>work involves a large number of hours spent using that display to write
>>C source. That serious enough for you?
>
>Which means you get an actual screen refresh rate of 40.5Hz.

It means nothing of the sort. If I was using a 40.5 Hz non interlaced scan,
then my effective screen refresh would be 40.5 Hz. An 81 Hz interlaced scan
is not equivelent to a 40.5 Hz non interlaced scan, by any stretch of the
imagination. Your argument, I'm afraid, does not hold water, and highlights
your lack of knowledge about why interlaced scans came about. The screen
is refreshed at 81 Hz, which reduces the raster flicker of the diaplay
to an amount where the human eye can no-longer detect it, hence the beating
present with low frequency non-interlaced displays is not present.
The tradeoff here comes with vertically adjacent pixels, which will cause
image flicker at a perceived level anywhere from 40.5 H to 81Hz depending on
their relative intensities. I run my monitor with the contrast turned all
the way to the top, and am able to perceive very little flicker indeed
in this mode when using it for tehe Workbench, and none at al (it looks
rock steady) when using it for graphics. I doubt you could say the same of
a 40.5 Hz non-laced mode, or even a 55Hz non-laced mode, where the flicker
would be ever present, no matter what the contrast.

>Which means
>that thin horizontal lines flicker at 40.5Hz on your screen, which at
>least for me means a serious headache after about an hour.

See above. You are basing your argument on the incorrect assumption that
an interlaced display is exactly equivelent to a non-interlaced display at
half the update frequency.

>>>Interlaced displays are actually
>>NEWER technology than non-interlaced displays, and were invented for the
>>sole purpose of reducing raster flicker. Yours is a sadly common misconception.
>
>Ah, well, so who invented non-interlaced displays before television?

The original televisions used a non interlaced display. Newer standards are
interlaced to provide a steadier picture. PAL and NTSC have not been around
since the beginning of time you know.

>Face it, "for a given bandwidth" interlaced displays are better, but given
>a resolution interlaced or non-interlaced with the interlaced one showing
>X frames/second and the non-interlaced one showing more than X/1.5 frames
>per second, you would always go with the latter!

Actually, providing the display is comfortable, I'd keep the flicker constant
and increase the resoloution. I do prefer interlaced displays, because I find
the beating of non-laced displays very harsh on my eyes unless they're
running at well over 70Hz.

>Great. Have you counted those color-triples on your TV lately?

My 'TV' is in fact a .28 dot pitch multisync, capable of TV scan rates.
However, some better quality PAL TV sets, with RGB scart input are capable
of horizontal resoloutions of over 800 pixels.

: [Summary : The Amiga is better than the Falcon]

It would appear that someone has lost the plot slightly. My original posting was not about the relative merits of the Falcon and Amiga. I was just trying to point out that the hardware of a machine is pretty irrelevant, you are always at the mercy of the market. For example, there's all this hype about Doom at the moment and no doubt we'll see a clone on the Amiga in the near future because some software company will say 'Doom has sold x thousand units on the PC, this type of game will sell'. When it does arrive it will be *crap*. Why? Because it relies on huge amounts of raw processing power and that is not the Amiga's strength. But, then how many 8-way scrolling, parallex shoot-em-ups or platform games do you see on machines like the PC or Mac which have raw processing power but no games orientated hardware.

The phrase that springs to mind is 'horses for courses'

In my experience, the flicker of an interlaced NTSC display depends on the image. For an image with smooth transitions, the flicker will be barely noticeable. With one with a lot of fine linework, it will be more noticeable.

Well, I don't know what "parallex" means, but for all the other points: Quite
a few, actually. You know, the PC *can* do smooth 2D scrolling. The 2D-
scroller-market is (used to be) dominated by Apogee, a shareware company.

The only one I ever played was called "Duke Nukem", you might check that one
out for a start (plays nicely on a 386SX-20).

>using djpeg (upon which JpegAGA is based) takes just over 20 seconds. Djpeg
>does not, of course, have to write to the screen, and so avoids
>any bus contention.

Well, even with ChipRAM's low bandwidth, writing 3/8 MB should not take
longer than a second.... Leaves us with about 19 seconds to calculate
the HAM8 screen. I would call that slow!

>>And each character of a VGA card is something like 15x9 pixels (maybe 18x9
>>or something, but far from being 1:1). So why do you try to mix text and
>>graphics resolutions?!?

>Why should I not use that resoloution? If i am doing graphics work for
>output to videotape, or something for a demonstartion that needs to
>be shown on a television, it makes sense to use the highest resoloution I
>can. When drawing graphics,raytracing, etc, the aspect ratio is irrelevant.

So why *did* you (was it you? I assume so, you deleted the attribution :-( )
quote the "aspect ratio" of the PC's textmode?!?

>It's by making efficient use of that bandwidth (such as
>HAM, interlaced displays, etc) that the Amiga manages to attain the performance
>it deos despite it's modest graphics bandwidth.

The resolution/framerate combinations it achieves are still pretty
unimpressive...

>>Which means
>>that thin horizontal lines flicker at 40.5Hz on your screen, which at
>>least for me means a serious headache after about an hour.

>See above. You are basing your argument on the incorrect assumption that
>an interlaced display is exactly equivelent to a non-interlaced display at
>half the update frequency.

No, I am not. It helps to read what the other one has written, you know?
"thin horizontal lines" *will* flicker, because they are only displayed
in one of the two halfframes....

My "total lack of technical understanding" at least allows me to see that
using interlaced modes may be fine for area-oriented graphics, but becomes
a nightmare for CAD or other line oriented stuff. And using it for text
doesn't work for me, either. Hey, I used to own a cheap monitor, I *did*
use interlaced modes.

>>>>Interlaced displays are actually
>>>NEWER technology than non-interlaced displays, and were invented for the
>>>sole purpose of reducing raster flicker. Yours is a sadly common misconception.
>>
>>Ah, well, so who invented non-interlaced displays before television?

>The original televisions used a non interlaced display. Newer standards are
>interlaced to provide a steadier picture. PAL and NTSC have not been around
>since the beginning of time you know.

I *do* know, and when I wrote this I knew I stepped on thin ice. I just
thought it was worth making clear that "newer technologies" referred to
the beginning of the century and had absolutely nothing to do with
computers or the displaying of text.....

>The only one I ever played was called "Duke Nukem", you might check that one
>out for a start (plays nicely on a 386SX-20).

Well, unless you're not being obtuse, and don't know what parallax is
either, then you'd realise that Duke Nukem (and Commander Keen, and all
those others) sucks rocks compared to stuff like Lionheart, SOTB I-III,
Brian the Lion, and even cheap crap like Yogi's Great Escape. The PC can
scroll a single layer fine, but games like SOTBIII have 16+ layers of
scrolling, all overlapping. (Lionheart has more than I can count - each
scanline on the backdrop seems to scroll at a different speed, and there
are 6 overlapping backdrop layers too. Blows away ANY scroller on the
PC, and I'd be willing to bet money on that.)

The PC may rule for 3D games, but for shoot-em-ups and platformers even a
humble A500 will leave a Pentium100 in the dust. (Go play Alien Breed
II AGA, Stardust and SuperFrog, then get back to me.)

In a previous article, CPB1001@phx.cam.ac.uk () says:

>>The Falcon's max.res. is not 640x480,
>
>Here we go again with these long lines. It's very annoying having to
>re-fromat your post you know.
>
>without adding hardware it's about 900x700 using BlowUp030 screen-driver.
> And with the ScreenWonder Pro (which is VERY cheap) the max. res. is
>

Do you actually have a Falcon or are you just making these up as you go along?

with 50Mhz pixel clock

in 2 color mode: one of MANY available modes but one I like to use a lot
1024x720 @98.3 i (this could be higher if I had a better monitor)
or
1312x720@81.1i

16 Colors
1040x688 @ 100.6 i
1024x768 @ 91.6 i
1024x768 @ 62.4
800x608 @ 137 i
800x600 @ 71.1

(all of the above refresh rates can be improved if you have a good
multiscanning monitor ie 30-64 khz horizontal range)

Blowup lets you configure your resolutions live automatically adjusting
the horizontal and vertical rez.

with 32 Mhz pixel clock

800x600 @65.2 n.i. in 16 colors
800x600 @64.2 n.i. in 256 colors
1024x768 @ 78.1 i in 2 clrs
960x704 @ 91.3 i

(these are not the highest resolutions but simply ones familiar to most
people chosen at good refresh rates. If you want to you can interlace the
display but your vertical frequency will double which would be too high for
most monitors)

>A1200 does 1280*512 on a TV in all color modes.
ooooohhh

800x512x16bit on my RGB is good enough for me

1280*512 on a TV is completely useless because of the aspect ratio, just like the Falcon one below.

>can do 1600x600 in 16 colors on a TV.
>Not if you're using NTSC you can't.
>
>>Hmmm, so you see I can't really agree on your statement....
>
>And I'm afraid yours are rather ill-informed and sparsely populated with
>facts.
>

You don't know shit about the Falcons video hardware which easily tramples your A1200's video. Hmmmmm what is the video bandwidth of your A1200 eh? Can you get the resolutions I listed from my setup?

PS3 is a brand new product - completely rewritten from version 2.0

Show me some complex software on the Atari that DIDN'T have bugs in its
first release. Thats why we have versions 3.1, 3.2 etc. Well, in the Amiga world
we usually do. Developement is somewhat more sluggish in the Atari world due
to lack of users.

But right now and for the immediate future its good. One day the Amiga will
end up like the Atari has been for the past number of years. Thats assuming
of course that the Amiga line stops right NOW. With 2 or 3 parties trying
to buy the technology theres a better than good chance that a year from now
Amigas will still be available.

Make sure you buy StarDust - its excellent. I'm going to get the
256-colour AGA superstardust which is due out now. Its tough choosing
what software to get - should it be SimCity 2000 AGA, Theme Park AGA
or UFO AGA? For aracders how about FIFA International Soccer or
Jungle Strike AGA.... You get the picture.

Games are the Amigas mainstay as there is such a large market (the
largest games market in the UK) but it also has a strong presence as
a video/graphics machine, especially in the states. The Amiga video market
should be worth at least as much as the ST audio market. Its like calling
the PC a game machine simply cause theres so much in the way of games for
it.

With a single floppy, it would be. Mind you, there aren't a lot of
OSs that _could_ run off a single floppy and offer full pre-emptive
multitasking these days.

Does MiNT/MultiTOS run off a single floppy?

I would use DaggeX. Notice the lack of trademark symbol, as well as the lack of x86 as well.

|> us and where is the Amiga?

Doing some hefty multimedia with Scala. It is used in some cable TV
stations in the U.S., some in house production for some companies, etc.
What's the size of the mpegs in the Falcon? 160x100?

Where's the Falcon?

|> Griff

BTW, I don't think the main purpose of this group should be bashing
Falcons...

He he he... ATARI is having *trouble* manufacturing and selling the Jaguars
which is the machine by which their own adimission is their new 'saviour/baby'.
I wonder if they are even manufacturing more Falcons right now.

Then tell us... since you are in the Falcon Owners Group, tell us.
Do you have a good multimedia program to synchonize envents, and
do real-time animation in at least the Falcon's 16-bit color in 320x200 + overscan?
(that's 30 frames per second)? Purchasing an accelerator is ok, but does that
software exists?

Any decent 3d animation software for the Falcon that can output in 24-bit
frames?

Any decent ImageProcessing program with batch file processing?

I am taling commercial quality, not just PD stuff...

Games are a measure of how good a computer is. A computer than can make
good games, is a good computer.

Don't try to do the 'serious attitude now', even Microsoft is going after
the game market now.

Exactly. The Amiga is being used in producing Babylon 5, SeaQuest and now
the upcoming Robocop TV series (for the special effects). Of course, there
are more things, but these are among the most important.

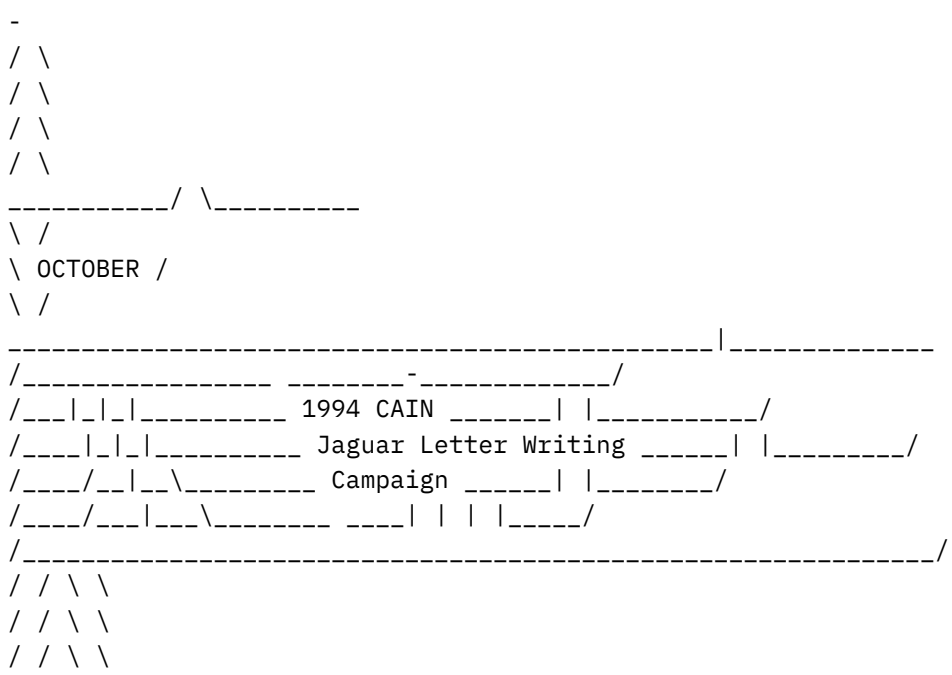
Like I said in another post, it depends on the CPU configuration. My
030/50 w/FPU and 8mb fastram A1200 using FJPG_AGA can display a 640x400
Jpeg in less than 6 seconds on average.

4052. OCTOBER Jaguar Letter Writing Campaign (Re-Post)

Newsgroup: comp.sys.atari.advocacy
Date: 1994-10-11 00:01:35 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <37ckl2$ap2@usenet.INS.CWRU.Edu>
Source record: 15352
Cross-posted to: rec.games.video.atari,comp.sys.atari.st,comp.sys.atari.advocacy,rec.games.video.misc,alt.games.lynx

I have been asked by several people to repost this October Jaguar Letter Writing Campaign text file. If you don't think this campaign will work then just don't write. But for those of you that want to see great games for the Jaguar, please read the following. Thanks.



Organized by: Len Stys

E-mail: aa399@cleveland.freenet.edu

The Jaguar 64-bit interactive multimedia system is the most advanced video game system ever created. If you are reading this, you either own a Jaguar or plan on buying one as soon as some more games become available for it. You are also interested in finding out what you can do to get your favorite games made for the Jaguar. I am glad to see that you are interested and if everyone participates in this campaign, we will _all_ be seeing our favorite games made for the Jaguar.

Will writing letters work? Yes, it will work. I've learned from my prior business experience that letter writing does work. There are many ways of determining a demand for a product, but nothing is more convincing to a company president than hundreds of letters from consumers that are asking for their product. Letters are concrete proof that demand exists.

Atari Corp. and Williams (WMS Industries) are talking. The Jaguar will be getting Defender, Joust, and Robotron. Is it because of our letter writing? Maybe. Will the Jaguar get Mortal Kombat II or Mortal Kombat III because of our letters? Maybe. If Capcom can make Super Street Fighter II for the 3DO, Williams can make Mortal Kombat II & III for the Jaguar.

If you do not see the games you want for the Jaguar in this campaign, do not be concerned! When the following game companies start making games for the Jaguar, the Jaguar will be on its way to becoming the most popular home video game system in the world! And when the Jaguar is on its way to fame, your favorite games will be made for it! But the campaign will not work unless you participate. And you cannot only write one game company and not the others. Each time one company signs to make Jaguar games, it helps get another company to make Jaguar games. Let's make this writing campaign the most effective video game writing campaign that the world has ever seen!

Ok, the companies we are concentrating on are companies that are familiar with high quality graphics and sound in games. Most of these companies are well-known for PC games.

The first part of this text is the October part of this campaign. The second part is the previous September part. If you are just beginning to participate in this campaign, you should write the companies listed in the September part as well.

****
****************************** OCTOBER, 1994 ******************************
****

Sierra On-Line Inc.
Dynamix Inc.
LucasArts Entertainment Co.
NovaLogic

>>>>>>>>>>>>>>>>>>>>>>>>> Sierra On-Line Inc. <<<<<<<<<<<<<<<<<<<<<<<<

Sierra On-Line is a company that is well-known for their role-playing games such as their Space Quest and Police Quest series. The company is also known for their latest hits in the PC world: Gabriel Knight, Aces Over Europe, and Leisure Suit Larry VI. Sierra On-Line is planning to release their new title, Phantasmagoria, very soon.

Sierra On-Line is definitely a company that needs to be developing for the Jaguar if the Jaguar CD-ROM is to become used. If Sierra On-Line starts making games for the Jaguar CD-ROM, several other companies will make games for it as well.

The mailing address for Sierra On-Line is:

Kenneth A. Williams, President
Sierra On-Line Inc.
P.O. Box 485

Coarsegold, CA 93614

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Williams,

1) How much you enjoy Sierra On-Line games.
2) How you have been buying Sierra On-Line games for your computer since the company started making computer games (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see Sierra On-Line producing several Jaguar CD-ROM games.
6) The games you would love to see on the Jaguar (choose two or three Sierra On-Line games).
7) How you believe Sierra On-Line games would be fantastic on the Atari Jaguar.
8) How you will run out and buy Sierra On-Line games when they are made for the Jaguar.
9) Thank you to Mr. Williams for reading your letter and for considering producing games for the Jaguar.

In my letter, I will also be encouraging Mr. Williams to make games which have the option of using a keyboard with the Jaguar. A keyboard can be created for the Jaguar and Sierra On-Line could work with Atari Corp. to produce one for it. The use of a keyboard in role-playing games help children learn words. This is something that Sierra has gotten away from in PC games.

I'm also writing Sierra to release HOYLE Card Games for the Jaguar. I love this game and it would be great to see a modem feature being used in the Jaguar version of this game.

>>>>>>>>>>>>>>>>>>>>>>>>> Dynamix Inc. <<<<<<<<<<<<<<<<<<<<<<<<<

Dynamix Inc. is a game company owned by Sierra On-Line. This game company makes many wonderful titles for the PC such as: Betrayal at Kronder, Aces of the Pacific, and Front Page Sports Football Pro. The company is planning to release: Front Page Baseball, Battledrome, LodeRunner: A Legend, MetalTech: Earth Siege, Alien Legacy, and an excellent reviewed game called Aces of the Deep (submarine game).

Dynamix Inc. is making some real great games and these games would be a very good addition to the present Jaguar game library.

The mailing address for Dynamix Inc. is:

Alan Higginson
Executive Vice-President
Dynamix Inc.

P.O. Box 978
Oakhurst, CA 93644-0978

The following is a list of things in which you may want to say in your letter to Dynamix Inc.:

Dear Mr. Higginson,

1) How you enjoy Dynamix games on the PC.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or three Dynamix games--I'm choosing Front Page Sports Football, Alien Legacy, and Aces of the Deep).
5) How you believe Dynamix games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Dynamix games when they are produced for the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>> LucasArts Entertainment Co. <<<<<<<<<<<<<<<<<<<

LucasArts is famous for making games based on popular movies. The company has also has several popular titles out for the PC. Some of these titles are: Star Wars Rebel Assault, X-Wing, Indiana Jones and the Fate of Atlantis, Monkey Island 2: Le chuck's Revenge, and Day of the Tentacle. And if there is any truth to the rumor of a new Indiana Jones movie, LucasArts will probably make a great game based on this movie.

The mailing address for LucasArts is:

LucasArts Entertainment Co.
LucasArts Games Division
P.O. Box 10307
San Rafael, CA 94912

The following is a list of things in which you may want to say in your letter to LucasArts:

Dear Sir or Madam,

1) How much you enjoy LucasArts games.
2) How much you enjoy the Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games you would love to see on the Jaguar (choose two or three LucasArts games).
5) How you believe LucasArts games would be fantastic on the Atari Jaguar.
6) How you will run out and buy LucasArts games when they are made for

the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX LucasArts by the phone number: 415/721-3344.

>>>>>>>>>>>>>>>>>>>>>>>>>>>> NovaLogic <<<<<<<<<<<<<<<<<<<<<<<<<<<<

NovaLogic is known for its high-quality games on the PC. The president and CEO, John Garcia makes sure each game title released is of the highest quality. NovaLogic is known for producing Comanche: Maximum Overkill (a game title that rated high on the Most Wanted Games for the Jaguar listing from CANI Newsletter). The company also produced WolfPack (a submarine simulator) and UltraBots. The latest and greatest game from NovaLogic is Armored Fist. This game is highly praised by reviewers that have seen it.

John Garcia is interested in producing modem games and networking games in the future. NovaLogic's games would be a great addition to the Jaguar game library.

The mailing address for NovaLogic is:

John Garcia, President
NovaLogic
19510 Ventura Blvd.
Suite 200
Tarzana, CA 91356

The following is a list of things in which you may want to say in your letter to NovaLogic:

Dear Mr. Garcia,

1) How much you enjoy NovaLogic games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple of NovaLogic games).
5) How you believe that NovaLogic games will be even more fantastic when using the graphics and sound capabilities of the Jaguar.
6) How you would like to see NovaLogic games that use the Jaguar voice-modem and networking capabilities.
7) How you will run out and buy NovaLogic games when they are produced for the Jaguar.
8) Thank Mr. Garcia for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX NovaLogic by the phone number: 818/774-0684. Please consider writing NovaLogic through the U.S. mail first and then FAX NovaLogic.

Please spread the word around about this letter writing campaign on online systems, BBSs, message areas, user groups, and any other place that you can help get the word out abuot this campaign.

Also, please tell your friends! It is very important to get everyone participating in this letter writing campaign!

********** THANK YOU! **********

****
********** SEPTEMBER, 1994 **********
****

Atari Corp.
id Software
WMS Industries Inc.
Capcom USA Inc.
Electronic Arts Inc.

>>>>>>>>>>>>>>>>>>>>>>>> Atari Corp. <<<<<<<<<<<<<<<<<<<<<<<<<<

First, we will first be writing Don Thomas, Jr. at Atari Corp. to let him know that we are participating in these campaigns. No, we aren't writing to annoy him. We are writing him so that Atari Corp. knows the magnitude of this letter writing campaign. If Atari Corp. knows that five-hundred people will be writing Dynamix in October, the appropriate person at Atari can contact this company on becoming a developer for the Jaguar during this time. Do not expect a letter from Don Thomas, Jr. We are not writing him for a response. We are only writing him to inform him of what we are doing.

Atari's mailing address is:

Atari Corp.
Attn: Don Thomas, Jr.
1196 Borregas Avenue
Sunnyvale, CA 94089

Place the letters: C.A.I.N. at the bottom left side of the envelope so that Atari will know what it is for.

Please use the following form letter:

(date)

(your address)

Don Thomas, Jr.
Atari Corporation
1196 Borregas Avenue
Sunnyvale, CA 94089

Dear Mr. Thomas,

I am writing you to inform you that I will be writing the following
game companies to encourage them to make games for the Jaguar.
I hope that my efforts will help Atari Corp. to sign these companies
to make games for the Jaguar.

The companies I will be writing are:

September: WMS Industries, Capcom, Electronic Arts
October: Sierra On-Line, Dynamix, LucasArts, NovaLogic
November: Spectrum Holobyte, Psygnosis, Origin
December: QQP, Broderbund, Konami

Thank you for reading my letter and for recording the number of
people writing these companies.

Sincerely,

(sign your name)

(print your name)

>>>>>>>>>>>>>>>>>>>>>>>>>> id Software <<<<<<<<<<<<<<<<<<<<<<<<<<

The letter to id Software should thank the company for producing
Wolfenstein 3-D for the Jaguar, encourage them to make Jaguar DOOM the
best that they can make it, and to encourage the company to make
QUAKE for the Jaguar.

id Software's mailing address:

Jay Wilbur, CEO
id Software
Town East Tower
18601 LBJ Freeway
Suite 615
Mesquite, Texas 75150

The form letter to Atari Corp. is the only form letter that will be used
in this campaign. This is because companies do not take form letters as
seriously as those that are originally written.

The following is a list of things which you may want to say in your
letter to id Software:

Dear Mr. Wilbur,

1) How much you enjoy Jaguar Wolfenstein 3-D.
2) How much you like id Software.
3) Thanks for making Wolfenstein 3-D for the Jaguar.
4) How you would like to see the best graphics possible for DOOM
on the Jaguar.
5) How you would like to see four-player or more networking capability
for Jaguar DOOM.
6) How you are excited about Jaguar DOOM coming out this year.
7) How you would like to see QUAKE made for the Jaguar.

8) Thank you to Mr. Wilbur for reading your letter.

Another thing which you may want to include in this letter is concerning the Jaguar resolutions. id Software is using a lower resolution on the Jaguar because they want to get the game as quick as Jaguar Wolfenstein. I, personally, do not care if Jaguar DOOM is as fast as Wolfenstein. One suggestion could be to make two modes (just like on the PC). One mode is for higher resolution and slower speed. The other mode is for a lower resolution, but higher speed.

>>>>>>>>>>>>>>>>>>>>>> WMS Industries Inc. <<<<<<<<<<<<<<<<<<<<<<

As of September 14, 1994, Mortal Kombat II is not being produced for the Jaguar. And Acclaim has no plans to produce Mortal Kombat for the Jaguar. But next year, WMS Industries will be able to release Mortal Kombat II for any game system that the company wishes to release it for. The time is now to let WMS Industries know that we want to see Mortal Kombat II and Mortal Kombat III for the Jaguar.

Mortal Kombat II is by far the #1 most wanted game for the Jaguar according to the Most Wanted Games for the Jaguar list by CAIN Newsletter. If this game is released for the Jaguar, the Jaguar will be the most wanted game system.

The mailing address of WMS Industries Inc. is:

Louis J. Nicastro, CEO
WMS Industries Inc.
3401 North California Ave.
Chicago, IL 60618-5889

OK. I don't think I have to remind you that you should write as neat and as professional as possible to get the best results. If you certify your letter, you may even reach the president with your letter.

The following is a list of things in which you may want to say in your letter to WMS Industries Inc.:

Dear Mr. Nicastro,

1) How much you enjoy Mortal Kombat II
2) How you like the games that WMS Industries makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get the game for the Jaguar as soon as it is released.
6) How you would also like to see Jaguar be the first system to get Mortal Kombat III.
7) Thank you to Mr. Nicastro for reading your letter and for considering making Moral Kombat II for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>> Capcom USA INC. <<<<<<<<<<<<<<<<<<<<<<<

Capcom is known for producing the Street Fighter II series of games. The company is also known for producing games such as The Great Circus Mystery Starring Mickey & Minnie Mouse, Demon's Crest, and Saturday Night Slam Masters. The company also does conversions of popular titles such as Wizardry V and Eye of the Beholder.

Super Street Fighter II Turbo is second only to Mortal Kombat II on the most wanted games for the Jaguar CAIN Newsletter listing. If the game existed for the Jaguar, it would no doubt sell a lot of Jaguars. But Capcom is not making Super Street Fighter for the Jaguar and no plans have been announced to do so in the near future.

The strange thing is that Capcom is making Super Street Fighter II Turbo for the 3DO platform. The game will even have better graphics than that on the SNES and Genesis. But this only means that if Capcom will make a version of SSFIIT for a much higher-priced system than there is a chance that the company will be willing to make a Jaguar version.

The mailing address for Capcom USA Inc. is:

Scott Smith
Product-Development Coordinator
Capcom USA Inc.
475 Oakmead Parkway
Sunnyvale, CA 94086

The following is a list of things in which you may want to say in your letter to Capcom USA Inc.:

Mr. Smith,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get Super Street Fighter II Turbo for the Jaguar as soon as it is released.
6) Thank you to Mr. Smith for reading your letter and for considering making Super Street Fighter II Turbo for the Jaguar.

You may also want to FAX Capcom USA by the phone number: 408/774-3995. But sending mail through the U.S. Postal Service may prove to be more successful.

>>>>>>>>>>>>>>>>>>>>> Electronic Arts Inc. <<<<<<<<<<<<<<<<<<<<<<<

Electronic Arts is the publisher of some incredible games such as: NBA Showdown, FIFA International Soccer, PGA European Tour Golf, NHL Hockey '94, Wing Commander, Super Wing Commander, John Madden NFL Football, Escape from Monster Manner, Twisted, Mario Andretti Racing,

MLBPA Baseball, and many more! Electronic Arts also owns several other software companies that they may give the OK to develop the Jaguar for if they see there is a demand for Jaguar games.

Unfortunately, Electronic Arts is also a major backer of 3DO, a company that is a big competitor of Atari Corp. Electronic Arts is spending a lot of time and money on making games for 3DO that it could be spending on the Jaguar.

There is hope though! Electronic Arts is a licensee. This means that the company has Jaguar developers units. Electronic Arts' management just has to give the OK to make games for the Jaguar.

The mailing address for Electronic Arts Inc. is:

Lawrence F. Probst III, President
Electronic Arts Inc.
1450 Fashion Isle. Blv.
San Mateo, CA 94404

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Probst,

1) How much you enjoy Electronic Arts games.
2) How you have been buying Electronic Arts games for your computers since the company was started (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) The games that you would love to slee on the Jaguar (choose two or three Electronic Arts games--I'm choosing John Madden NFL Football!).
6) How you believe Electronic Arts games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Electronic Arts' games when they are produced for the Jaguar.
8) Thank you to Mr. Probst for reading your letter and a thank you for considering producing games for the Jaguar.

You forgot to mention that the Falcon can only do 640x480 at upto 16,xxx
Colors where as the 1200 has fast video modes with multi-synces and does
upto 1280x480 (more with overscan) and 200,000+ colours out of 16.2mil..

Actually, with 2 floppy drives you have a very usable system. Just
keep workbench in the internal drive and use the external for storage.
I used a 2 floppy 1meg A500 for a couple of years and I was very happy
with it. Of course, after moving to a 6 meg 1200 with HD going back would
be a pain but for the home user who wants to tinker with machines theres
no need to spend big on HD and memory.

My, you are a rude man, aren't you? You've also missed what he was saying,
as the 50MHz clock is only available with external hardware.
25MHz and 32MHz are the internal clocks. I use BlowUp Hard II to get
a higher clock rate.

You didn't listen, did you? JpegAGA does NOT render it's JPEG image up in a
FAST ram buffer and then cpb blit the image to CHIP RAM. It renders the jfif
direct to CHIP RAM, on the fly. No doubt it would be significantly faster if
it did render into FAST RAM first. It would also use twice as much memory.
DJpeg was writing raw 24 bit data out, JpegAGA is doing rather a lot of
processing, of which a HAM conversion is only a minor part. It also has
to organise the data in a form suitable for displaying on the Amigas
planar screen (unless it's using WirtePixel(), which I doubt, because
most Amiga programmers avoid that one like the plague.)

>>>And each character of a VGA card is something like 15x9 pixels (maybe 18x9

>quote the "aspect ratio" of the PC's textmode?!?

Because you wanted to know what use such an aspect ratio was to anyone.
Remember, 100 million MS-DOS lemmings can't be wrong, can they? :-)
I really do not see what peoples hang up about non-square aspect ratios is.

Some things require them (or are made significantly easier by their presence),
yes, but in a large number of cases, no-one could really care less about the
pixel aspect ratio. So, I ask you, why not use non-square aspect ratios?

>>It's by making efficient use of that bandwidth (such as
>>HAM, interlaced displays, etc) that the Amiga manages to attain the performance
>>it deos despite it's modest graphics bandwidth.

>The resolution/framerate combinations it achieves are still pretty
>unimpressive...

Am I to take it that you have not seen a HAM8 CDXL animation then? Without
sopecialist MPEG hardware, I have yet to see anything that can come close
to the Amigas ability to animate straight off a CD. This is possible because
of HAM.

>>>Which means

>No, I am not. It helps to read what the other one has written, you know?
>"thin horizontal lines" *will* flicker, because they are only displayed
>in one of the two halfframes....

No they will not (or at least will not be percieved to flicker, all monitors
flicker, remember). Because the two adjacent lines have been refreshed in that
frame, the eye sees those, as long as they do not contrast too highly with
the line that has not been displayed. The eye is generally a lot better at
seeing what is there, rather than what is not. We're talking about two lines
that are a fraction of a millimetre apart here. Can I ask if you ever watch
television? Notice that whilst watching a TV picure at 50 (or 60)Hz interlaced,
one normally finds it very hard to percieve the flicker, precisiely because
of the low contarst in the true-life images that TV's display. However, one
would not, generally, use a TV to display 640*512 8*8 white fonts on a black
background, because the flicker would then become annoying. Image flicker
(that is, flicker caused by interlacing due to contrasting lines) at 81Hz
is bordering on the in-percieveable, even in high contrast areas, and at
that frequency, I have yet to meet anyone whose eyes are good enough to
percieve any raster flicker (flicker from low-refresh rates, the 'beating'
that is quite noticible on 60Hz and below non-interlaced screens) at all.

>My "total lack of technical understanding" at least allows me to see that
>using interlaced modes may be fine for area-oriented graphics, but becomes
>a nightmare for CAD or other line oriented stuff. And using it for text
>doesn't work for me, either. Hey, I used to own a cheap monitor, I *did*
>use interlaced modes

I used to own a cheap monitor too, only capable of 15KHz displays. I did not use interlaced modes, because the flicker annoyed me. Now I own a .28 dot pitch multisync, I do use interlaced modes because they provide me with a higher resoloution and less percieved flicker than equivelent bandwidth non-interlaced modes (there is very little difference between non-interlaced DblPAL high-res 784*550 @48Hz and Super72, 800*600, interlaced @81Hz in both bandwidth and resoloution. I spend very large amounts of time doing text editing in the latter mode (C source), whereas the former mode gives me a headache after a few minutes.). Your argument has 2 major flaws:

1) You seem to be equating interlaced displays with low frequency refreshes. This is probably, I would guess, because all, or the majority, of interlaced displays you have seen have been television type displays. There is nothing inherent in interlace technology that forces it to be used with low frequency displays. It is just that traditionally, interlace has been used to make low frequency displays more bearable, and so people make the connection between interlace and low frequencies, and build up this irrational stigma against it which you seem to be exhibiting.

2) You are equating image flicker with raster flicker. Again, a common mistake that whilst intuitive, has no basis in fact because of the very different ways the two types of displays work. Image flicker at X Hz is significantly LESS offensive than raster flicker at X Hz. Complaining about an 81Hz interlaced displays 40.5 Hz image flicker, using 40.5 Hz raster flicker as a reference is fundamentally flawed. It's like measuring the distance it takes a small car to stop in from 60mph, and then expecting a fully laden freight train to be able to stop in the same distance from the same speed. Apples and oranges.

[snip]

>>The original televisions used a non interlaced display. Newer standards are
>>interlaced to provide a steadier picture. PAL and NTSC have not been around
>>since the beginning of time you know.
>
>I *do* know, and when I wrote this I knew I stepped on thin ice. I just
>thought it was worth making clear that "newer technologies" referred to
>the beginning of the century and had absolutely nothing to do with
>computers or the displaying of text.....

It has everything to do with it, since computer displays are still relying on exactly these two display technologies, practcally in their original form.

Games are a good measure of how good a computer is? That's
a joke, plain and simple. The Super Nintendo has some nifty
games.... care to word process with it, Raist? You get my
point, I hope. Serious apps and games are two entirely
different things.
BTW, most of these graphics packages you are listing for the
Amiga.... care to list their prices? They are _not_ within
my price range and I doubt many others. You make it sound
as if these packages are in easy reach for the average Joe.
I can get Griff's MPEG player off an FTP site if I wished
but I can't fork out $xxx for Scala, Raist. Your arguments
are silly.

Net-standard but not for Europe, you try finding a WWW site in Europe, it
just doesn't happen in the Atari world, it doesn't really need to either.
Besides, do you actually _use_ Mosaic on your Amiga? I don't envy your
phone bill mate, and which version is it? Can it handle the new live
video feeds? Can it play tracker modules or mpegs? Just how up to date
are you with the current NCSA versions?

I use the latest version here at University, but that's running on a DEC
Station 5000 and its slow enough! I'd hate to see it on any standard
home computer, it must be hell.

The first web site I ever browsed with Mosaic was at Aachen, Germany.
(It had the Terrorists handbook docs BTW!).

No, a friend does use it on his A4000 though from home via AMITCP and
a SLIP connection. He is hapy with it, and he is the main contributor
to a new internet magazine. Mind you, he never had the luxury of using
a high-bandwidth university link.

Its obviously crap if you can't get it for the Atari.

But ability to play a good game is usually a good indicator
of graphics processing prowess. Just because there are relatively
few for the Falcon isn't because it is crap though, just that
its not popular enough for mass-market product. At least the
Amiga has more support.

> I can get Griff's MPEG player off an FTP site if I wished

Actually, I got a really good version of SCALA VT (video
titling version) FREE of an amiga mag. I also got hyperbook
off the same mag, and CanDo off another. Not the latest versions,
but still pretty good and better than anything I have seen on
the Atari.

Exceeding - yes, but theres still LOTS of Amiga stuff. We get most
of the good PC games and most of the good console games. In the arcade
and platform dept the Amiga still exceeds the PC in software choice
and quality.

> Funny how it took
> _so_ long for any decent AGA stuff to appear isn't it?

So what? Its here NOW and there are lots of new AGA games out.
Sim City 2000 has finally made an appearance - at last a game that
requires an A1200 with fastRAM and HD.

> Besides if I
> wanted games I'd buy a SNES (or an Amiga) but I don't, so I'm quite

Amiga owners can have most of the 'home computer' advantages of
the Falcon, but with greater software choice. For the most choice
you need a PC but for various reasons I wouldn't even consider a
PC or Mac for home use. For HOME computing, Amiga is the best.

Even when your application prog and data can't fit on the same
disk as your OS? And on, say, a 2 meg machine?

If your app and data can go on the same disk, swapping isn't
a problem and if you have enough memory in your machine you can
make a lot of the OS resident or put it in a ramdisk.

I bought a second hand F030/4/65 some months ago... I am just a little
disappointed. Here is a short list :

Graphics Redraw:- this is a crime and still is. Why should I have to spend
#30 to get it up to scrath.

Lack of CLI:- I was amazed that no CLI or shell window was provided.
Lets face it a CLI may not be very user friendly but without
it a system is near useless. Take the Amiga, it has a
(not too friendly) but fast CLI, which take me on to my
next point.

TOSWIN:- Although this is not strictly supplied with the machine it is
apparently faster than the one supplied by Atari. It too is
extremely slow. It is so bad that the characters are printed
one at a time!!! This is DREADFULL.

File_Names: Yes, we are still restricted to the 8.3 format.

MultiTasking:- In two forms: Co-op : this is very fast but the
interface is awful!!! You cannot for
example simply iconify a progam and switch
back to it later.

pre-emptive: well MiNT is OK, if a little
buggy, but is also quite sluggish. My old
Amiga 600 managed better!!!

TOS:- The version I have 4.01 is full of bugs!!

That said I still like the machine but only JUST. If Atari had done a
decent job of it in the first place perhaps sales might have been a
bit higher. I mean why should I need a replacement desktop, or a new
OS. These should either be not-supplied and bought seperate or be of
a reasonable standard in the first place!! If they weren't made by
Atari perhaps we'd have cheaper machines in the first place.

How dare you say that GEM is a dream compared to Workbench? GEM is so rubbish. I have an A1200 witha 65Mb hard-drive. The default Workbench loads in 5 seconds, my Workbench loads up in around 12 seconds. So what if workbench takes ages to load using a floppy ... every tried using a PC or Macintosh with just a floppy drive (It can't be done!). An A1200 with a hard-drive is a dream to use. I have to wait about three minutes to use a PC when it is turned on, two minutes when a Macintosh is turned on and 10 seconds when my Amiga is turned on (ooer!). I know which one I prefer.

: Well, I don't know what "parallex" means, (Oops, should be parallax)
^^^^^^^^ ^
If you are travelling along in a car and you look at objects that are close
to you they appear to be moving far quicker than objects further away -
that optical effect is parallax.

Anyway, in terms of computer games this means having multiple screen layers
scrolling at different rates. The Amiga is unique, by virtue of 'Dual
Playfields', in being able to set up two screen displays and to overlay them
in such a way that you can see one screen through colour 0 of the second. By
then scrolling them at differnt rates you end up with convincing parallax
scrolling.

To achieve the same effect on a machine without the Amiga's custom chips
would, I imagine, require clever use of XORs to overlay one screen over the
other (The front screen would have to treated like a giant software sprite)

{Games programmers on MACs & PCs feel free to correct me I'm only guessing
that that's how you'd do it}

Actually, any machine with bitplane graphics can do parallax - the more
bitplanes, the more colours/layers.

: using djpeg (upon which JpegAGA is based) takes just over 20 seconds. Djpeg
: does not, of course, have to write to the screen, and so avoids
: any bus contention.

40 seconds? Even if that includes the 20 seconds Djpeg time it's still
damn slow. I have two programs - DSPJPEG and JPEG220 both of which will
do the above (768x512 and much greater than that) in a lot less time.
I'll get some figures written down for you all tonight, but on average a
640x480 jpeg takes about 3-4 seconds to decode and display. I'll confirm
other sizes sometime this week.

Hey a question for all you Amiga owners... why does it take so bloody
long for your machines to reboot/recognise a reset ??? We have an A1200
in the house and it can take anything up to 15-20 seconds before the
computer even considers accessing the internal drive after a CTRL-CBM-CBM
reset. Is this a hardware design thing? Granted, sometimes it _does_
reboot quite fast, but certainly not often enough.

I believe it is public access. Your use of the word dial seems to imply
that you are using some sort of service provier with limited internet
access, rathger than a full internet connection, so I wouldn't know
wether you personally can get in or not.

>And why do you avoid all my other points? Ie how up to date is your
>Amiga Mosaic version?

Wouldn't know, since I don't use it. I do all my net access from the
computer labs UNIX machines, and haven't found the time or need to connect
my Amiga up. Perhaps someone who uses AMosaic can answer your latter points,
I just wanted to address your first.

Some Amigas (the A1200 being one) have a feature whereby a reset can be
delayed by upto 10 seconds for programs to save unsaved data, shutdown properly
etc. If there are no programs with a reset handler, then it should reboot
quickly. Some demos, however (and I presume games, I wouldn't know since the
games I play most of the time (mainly Frontier) multitask and behave
themselves) mess this system up and hold the reset back for no apparent reason.
It should, however, be impossible for it to take longer than 10 seconds. If
this is the case, then I suspect you may have a hardware problem.

Actually, it was possible to change the address of the video memory
somehow - I saw a demo that swapped 4 or 5 screens using this method way
back in 85...

(I've been playing with a Spectrum 128 emulator (z80 - get it, it's
great!) a lot recently, and I'm amazed at some of the games - StuntCar
Racer, Captain Blood, Virus - 3D graphics! Who needs DOOM? :)

Now all I need is a copy of Bugaboo the Flea, and I'll bet set for life!

Well, the delay on power-on is to give an internal IDE enough time to
spin-up, and the delay on reset is for the same reason, although it's
unneccessary really. (Still quicker than the PC, which insists on
showing you all the BIOS information every time you reset, just in case
your CPU magically chnaged or something. :)

Now a question for Falcon owners - on my old 130ST (yes, 130ST, let's not
have this argument again) if I didn't put a disk in the drive, I'd get the
oh-so-lovely GEM after about 30 seconds - does the Falcon do this, and did
they speed it up any? (The delay, not the machine. :)

I think we should all give Gaven a hand for bringing some life
back to this forum. Until his return, he seemed to be stuck listening to
Sinclap's irrititating commentary. Today, we have some good, clean,
educated brawling! Thanks!

Isn't the delay on the A1200 for the purpose of letting internal HDs spin up in time?

>every tried using a PC or Macintosh with just a floppy drive (It
>can't be done!).

That must come as a real surprise to all those people owning PCs and
Macs. Gosh, even I have a MacPlus (with a single floppy drive), which is
quite usable, and a 486 (on which I sometimes disable the harddrives, just
to be on the safe side), which is also quite usable with just floppies...

>I have to wait about
>three minutes to use a PC when it is turned on,

Care to tell what you are doing? Running Windows NT on a 16kB IBM PC from
'81? Some realistic startup time:
-memory check: 2 seconds (with "check above 1 MB" disabled)
-loading linux via lilo: 2 seconds
-uncompressing kernel: 1 second
-kernel startup: maybe 5 seconds
-starting gettys, daemons... : maybe another 5 seconds
-starting X : app 5 seconds
-opening a few xterms etc: maybe another 5 seconds, probably less

So here we are, 25 seconds, and that gives you a full MP, VM, networked
and multiuser multitasking OS with a network transparent GUI which
implements everything under the sun to save memory. It also has a certain
level of security in its filesystem.

Now I admit this is more than your "13 seconds", but on the other hand, what
comes up does a lot more as well. Booting DOS seems to be a matter of
seconds....

Yes, this is a bit of a joke, unfortunately. I run text-based programs
full-screen, it's faster then. But I can't multitask with GEM programs.

>File_Names: Yes, we are still restricted to the 8.3 format.
Not if you install a Minix file system (as supported by MiNT).

> pre-emptive: well MiNT is OK, if a little
> buggy, but is also quite sluggish. My old
MiNT isn't _that_ slow, it's the multitasking version of the AES that is
the main culprit.

>TOS:- The version I have 4.01 is full of bugs!!
Yes. An upgrade to 4.04 is essential.

What ARE you talking about? Do you mean Internet POPs - there are plenty
in the UK now. Ever heard of DEMON Internet for instance? Your post said
there weren't many WWW sites in Europe - period. Thats just plain wrong.

> And why do you avoid all my other points? Ie how up to date is your

The wait is while the computer checks for a hard drive and tries to boot
from it. It also polls from a printer. If you have a hard drive, the reset
is near instantaneous and if you have a hard drive and an active printer then
the reboot is immediate.

Most PCs sit around for 5-10 seconds before they even start to boot from
floppy. If you are going to windows after that it takes ages.

I got a spectrum emulator for my Amiga there. Its amazingly good, as it
seems to run everything with no problem. I've been playing Manic Miner,
jet Set Willy, Atic Atac, Sabre Wulf, Knightlore, StarQuake and lots of
other classics - Amazing! So much fun from such a primitive 8-bit
machine.

: can't be done!). An A1200 with a hard-drive is a dream to use. I have to wait about
: three minutes to use a PC when it is turned on, two minutes when a Macintosh is
: turned on and 10 seconds when my Amiga is turned on (ooer!). I know which one I
: prefer.

You have a hard drive for you A1200? Well you are lucky then, but they
do not come as standard do they? You have to pay quite a lot more for
them, often as much as the A1200 cost itself (if the Silica Shop adverts
are anything to go by). NewDesk (GEM TOS 4.04) is extremely advanced
and loads instantly - better than your 10 seconds.

So if you can't afford to buy a HD you are stick with an OS that is very
very unfriendly to use (insert disk x, insert disk x... etc etc etc), at
least with any ST/E/FALCON the OS is there, ready to use and lets you
access the base essential functions of your computer. If you magically
erased every disk in your collection your Amiga would be rendered
useless, whereas with the Atari range you can still use the Desktop and
perform those essential management functions.

Rod McCall (rmccall@mcs.dundee.ac.uk) wrote:
: Graphics Redraw:- this is a crime and still is. Why should I have to spend
: #30 to get it up to scrath.

No, you mean GEM Graphics redraw's. GEM is notorious for being very slow in the graphics department although programs like NVDI will do a lot to rectify this problem. It is also to do with the monitor which you neglect to mention, running the Falcon is something like 640x480 (VGA) in 256 colours is a rather nasty experience, yet 640x480x16 provides a perfect and fast working environment. True Colour screens are bloody fast even on my VGA and on the RGB they shift it around like nothing on earth - Chroma 24 and APEX Media being two fine examples. Why should you spend #30 on what btw ???

: Lack of CLI:- I was amazed that no CLI or shell window was provided.
: Lets face it a CLI may not be very user friendly but without
: it a system is near useless. Take the Amiga, it has a
: (not too friendly) but fast CLI, which take me on to my
: next point.

Has Atari _ever_ supplied a CLI for their machines? No. So why did you expect them to do so this time? If its a CLI you want then get the NeoDesk CLI from Compo. But I do agree with you and would love to see a powerful CLI for my Falcon which is why I am writing one myself, it has a lot of advanced functions (borrowed from MSDOS and Unix) and will be ready for beta-testing soon.

: File_Names: Yes, we are still restricted to the 8.3 format.

To retain PC compatability and Atari compatability - can you imagine the hassle Atari developers would have if they suddenly were faced with a completely new file name structure? It would be hell!

: MultiTasking:- In two forms: Co-op : this is very fast but the
: interface is awful!!! You cannot for
: example simply iconify a progam and switch
: back to it later.

I hardly ever use Mint, I find the speed of the system doesn't match the benefits I get from it. I'll wait until Ease/MagiC/Geneva get finished. not everyone wants or needs multi tasking, those that do know where to go.

: pre-emptive: well MiNT is OK, if a little
: buggy, but is also quite sluggish. My old
: Amiga 600 managed better!!!

: TOS:- The version I have 4.01 is full of bugs!!

Upgrade - TOS 4.01 is renowned for bugs as are most early operating systems and that was the first release. Compo were doing a TOS 4.04 deal for 19 quid, can't be bad.

: That said I still like the machine but only JUST. If Atari had done a
: decent job of it in the first place perhaps sales might have been a
: bit higher. I mean why should I need a replacement desktop, or a new
: OS. These should either be not-supplied and bought seperate or be of
: a reasonable standard in the first place!! If they weren't made by
: Atari perhaps we'd have cheaper machines in the first place.

You don't need a replacement desktop, you just need a few little essential ACC's and AUTO programs that make working life so much better. Everything I have in my AUTO folder to enhance my computing life is either PD or Shareware (with the exception of NVDI).

: No, you should be jealous of the MASSIVE (compared to Atari)
: Amiga user base, the wide software support, the variety of different
: Amiga models and the wealth of hardware Amiga add-ons that have NO
: Atari equivalent.

: gavan

We Atarians (well Falcon owners) do not need all the add ons as we already have

a 68030, SCSI II, DSP, MIDI etc, etc.

Therefore I think your argument about add-ons is a bit pointless. Likewise
we can go up to 32MHZ for only 60 ukp.

Do you know much about the Web? You just need internet access and
a web browser which you start by pointing at the appropriate web site.

> The only web providers I personally know of are very PC orientated and

I've never heard of a web provider - just internet service providers.
Demon do Internet access for 10quid per month, but of course phone
charges can add to the expense considerably.

The A1200 uses standard IDE hard drives of the type that fit in PC
machines - the cheapest you can buy. A 2.5" drive is recommended as it
fits perfectly in the case, but you can also shoehorn a 3.5" drive in
there if you want.

The OS is stored in ROM on the Amiga also. The Workbench is just a
graphical interface for file manipulation and program loading. Its what
loads from disk. You can boot without workbench and go straight into
a command line shell. All the common commands are available in rom
(dir,copy, delete etc.) Its mostly utitilties that have to load from
floppy/hard disk. The core of the OS is in rom. The problem is that the
Amiga has heavy use of shared libraries, of which only a couple are
in ROM. Thus, lots of programs need to have access to the shared library
to load it and you get the "insert disk in drive xxx" prompt when this
happens.

Thats interesting. What 68030 32MHz add-on is only 60 UKP? Does it make
provision for 32-bit fastRAM access?

As regards built in features, for the increased cost of the Falcon
I'd _expect_ the Falcon to have more.

I pointed out that you can get a 6 meg/80HD/28Mhz 030/882/SCSI-II A1200
for the cost of a 4/80 Falcon.

The Amiga has a faster CPU, a maths co-pro, and more RAM for the same
price. The Falcon has 16-bit sound and a DSP. If you need the sound,
go for the Falcon. If you want more processor power and RAM, with better
software support go for the Amiga.

What exactly do you mean by 'web providers'? Given that the web is a service based on the internet, any internet access provider provides you with access to the WWW automatically. Also, provided that the site which has the web pages you want to view is running a web server (which, incidentally, several places in the UK, including Cambridge, do), then you can access it without an account on the local system. Demon Internet (amongst others) provide direct internet access to UK customers, so I don't really understand what you mean by 'web providers'. Demon also DO support the Amiga (as far as I know, not being a customer of theirs), and have several local newsgroups for this purpose. So yes, an Amiga owner sat at home can run AMosaic and access the university's pages. They don't have to dial the university direct, they can get the pages through any internet service provider. I think perhaps you've got a little confused about what the WWW and the Internet really are.

Oh yes, that's why all current Amigas have harddisk interfaces and mountings
built in. They only did it to encourage users to run their OS from floppy.
Come on, pray tell, what is wrong with selling an HD less A1200, and allowing
the user to fit their own capacity drive, rather than imposing a standard size,
which may well be overly large for some, and too small for others. Don't know
about elsewhere, but here, the vast majority of A1200 users have hard dirves.
I can only assume that the minority either are saving up for one, or bought
their machine merely to play floppy based games on it.

There exist dial ups onto the university fibre-optic network, but AFAIK
the univbersity does not allow their use by non-members of the university, since
there are a limited number of dial ups. OTOH, there is this thing called the
INTERNET, which an Amiga owner sat at home running this Mosaic could (via a
service provider for as little as 12 UKP per month) use to access any WWW site
they wnated anywhere.

> ok?
>
> The only web providers I personally know of are very PC orientated and

I assume you're reading USENET via some sort of BBS, You really should try
doing it properly via the internet. Once you've paid your 12 pounds
subscription for the month, practically everything is free. (I'm making the
assumption that the Falcon has the necessary software to enable it to be
an internet node, perhaps it doesn't and this is the cause of any
misunderstanding. The required Amiga stuff can be obtained via anonymous ftp
from demon.co.uk for free, and is quite extensive.)

You seem to be confused, Sinclap hates anything that is not a Macintosh. I
believe he was merely commenting oin what he thought to be the lesser of
two evils. With the exception of its sound and DSP hardware, I fail to
see where the Falcon even comes close to the A1200. It's behind graphically
(The Falcon has slightly morre graphics bandwidth, but the A1200 uses it more
efficiently), it's CPU is slower due to the 16 bit bus, it's software
support is verging on non-existant (show me something like Wordworth 3.0b or
Final Wrier II on the Falcon), and the A1200 has a much more capable, and IMO
nicer to use, OS.

a 68030 crippled by a 16 bit data bus. Can you say 386SX?

From what I can gather, the Falcons so called SCSI II is actually
a SCSI I on steroids, and certaibnly does not achieve the transfer
speeds one would expect of SCSI II. Some IDE PCMCIA drives on the A1200
transfer over 1.5 megabytes per second.

The DSP is useful, but limited because it's only an integer uint. I'll keep
my 25MHz 68882 thanks.

MIDI Why should I pay for something I'm never (along with the majority of
users) going to use.

> Therefore I think your argument about add-ons is a bit pointless. Likewise
> we can go up to 32MHZ for only 60 ukp.

Still on that 16 bit bus, is it? Unfortunate that.

[paralax scrolling]
To achieve the same effect on a machine without the Amiga's custom chips would, I imagine, require clever use of XORs to overlay one screen over the other (The front screen would have to treated like a giant software sprite)

On the Atari STE/TT and Falcon you can easily do this with the hardware scrolling - you can set it up to scroll each line of the screen independently.

You shouldn't.

People buy computers to use them. If a computer doesn't do what you want
then don't use it. The people who own Falcons do so because they do what
the user wants to do.

I'm so glad that you are happy with your non-midi computer, I am happy
with my midi computer.

What a happy world .advocacy is.

MiNT certainly does. A couple of years ago I had MiNT (v0.6 IIRC), TOSWIN and GNU C (!) all running off a floppy drive 2.5Mb RAM STFM! The newer versions do as well, but I wouldn't imagine you could get all the extras like MiNTnet running effectively.

I have had MultiTOS running off a single floppy drive STFM. But on an STFM, it's pretty slow, and no-one I know uses a Falcon (which is much more the machine for multitasking) without a hard drive anyway.

4121. Hidden costs

Newsgroup: comp.sys.atari.advocacy
Date: 1994-10-12 13:44:57 UTC
From: csc3nsc@gps.leeds.ac.uk
Message-ID: <1994Oct12.134457.26807@leeds.ac.uk>
Source record: 15244

I was thinking of buying a computer later this year, and the falcon was on my list. The ads in the atari press made it look a good buy, but reading this news group has made me think again. I knew that I would need 4 megs of RAM, but the ads said that the motherboard could support up to 14 megs. I also didn't the number of extra programs that I would need to make the OS useable. (the bit about having a 32 bit cpu and only 16 bit architechture also made think again)
The reason that I considered the Falcon was that it had the type of graphics and sound capabilities that I was looking for in a computer. I was not looking for a games machine but something to due programming on (AV type stuff). The Amiga option was too expensive as I would need a 4000 with add on sound card as well as a scsi-2 card.

What I really want to know is that are there any other hidden cost that I do not know about yet? I do not want to buy a machine and end up using it as a door wedge because I cannot aford the upgrade to make I usable.

Neil

Chris (Brown),
I have never seen Wordsworth or Final Copy for the Ami. I would venture a guess, though, that Compo's Write On, Papyrus and AtariWorks can keep up, thanks. And with Speedo GDOS 5 I can use Adobe Type 1 fonts as well as True Type. What types of fonts do your progs use?
Also, are there low cost word processors for the Ami? When I had an Amiga 500 I could not find any PD editors or low cost commercial options (well, I did ask my Amiga dealer for advice). Has this situation changed at all? For the Atari, people on a tight budget have loads of good editors to choose from in the public domain and commercial world.

Mostly compugraphic, as thats the scaleable type that the OS
uses too.

> Also, are there low cost word processors for the Ami? When I

Transwrite is very good and also very cheap. theres a stack of
PD editors and WPs which are quite good, especially for free.

Adobe, Compugraphic, TT, PS and Amiga bit-mapped fonts, and I think
there's another format, but the name escapes me at the moment.

Well, you should have got MEmacs with your system, which is a pretty good
editor considering, but there are PLENTY of PD editors and cheap WP
packages, and have been since I got my 500 about 4 years ago.

But what about scrolling different LAYERS (ie one on top of the other)?
I can even do that in crummy BASIC -

```
Screen Open 0,320,200,2,Lowres
Paper 0 : Flash Off : Curs Off
Ink 1
For X=0 to 5
Circle Rnd*320,Rnd*200,Rnd*30
Next
Screen Clone 1,0
Dual Playfield 1,0
Do
Add P,2,0 To 319
Add Q,3,0 To 319
Screen Offset 0,P,
Screen Offest 1,Q,
Loop
```

There - that'll draw two OVERLAPPING screens, one visible through the
other, and scroll them at different speeds...

Go look at SOTBIII... :)

>ok?

Once again, you seem to have misunderstood the WWW. You do not have to
"dial" Chris' university to access the Web page. You use a WWW browser,
such as Lynx, and access it from YOUR site - lynx http://www.cl.cam.ac.uk/
should do the trick.

>The only web providers I personally know of are very PC orientated and
>they charge amazing amounts of money which, considering how slow web can
>be sometimes, is a bit off really.

With statements like this, you lead me to believe that you aren't clued
in on how the 'Net works. What, exactly, is a "Web Provider"? My site
provides WWW access, and I have my own WWW page (http://satelnet.org/~mentat/)
and anybody can look at it, free of charge. You don't need an account on
MY machine, you just need an account SOMEWHERE...

(Oh, and my WWW page has NOTHING to do with PCs, either. :)

But if I'd erased all my disks, the management functions would be damned
useless, as I'd have nothing left to manage. (And also, if I erased all
my disks, I'd consider myself too dangerous to be allowed near a machine,
and go and be a hermit and live on nuts and berries. (Or buy a Mac. :))

No, I never used a Falcon, but I know former owners who have.. And I don't use
and own an A4000.

Also, the Falcon is about non existent here in the U.S.!

Almost any ATID drive is compatible with the A1200, and these drives
cost just as much for A1200 as they cost for other platforms. You _can_
fit a 3.5" drive inside the A1200 case.

This "no HD as standard" is bullshit, since anyone who is going to do
anything with his/her A1200 WILL buy a HD for it. A computer without hard
drive == games console.

Please, let's not have the 'ham8 is slow' or 'sucks' argument
again, as it has been beaten to death.

If you are drawing in real-time or converting 24-bits to ham8
the computer would have to 'think' and thus it would be 'slow'.
Drawing, of course, isn't as slow as converting from jpeg or
24-bits (a whole screen).

This 'slowness' is in calculating proper ham8 offsets. Now,
if you have Ham8 screens ready or Ham8 anims, then it is as
fast as any other mode.

I have done 30fps, NTSC 320x200+overscan animations with
Scala.

This is just information, no flames, no insults intended,
etc.

True... the problem is when you have dual-playfields too. Like a fence
in front of the background, which also has parallax scrolling.

Most badly setup PCs that is, right?
Nearly all modern PCs can skip testing memory above 1MB, and nearly all
can also completely ignore floppy drives and go for the harddisk as quickly
as possible.

It's just changing some very obvious things in the BIOS, you know. Not that
any good computer would have to boot often, anyway.... A serious computer
runs 24 hours a day, and is ready as soon as I sit down at it.

Bernie

P.S.: Even starting Windows is a matter of seconds on a 486!

>direct to CHIP RAM, on the fly.

So what? Does that mean that it magically needs to write several Megs of data?
The answer is no; The resulting HAM8 image is still only 3/8 MB big.

>No doubt it would be significantly faster if
>it did render into FAST RAM first. It would also use twice as much memory.
>DJpeg was writing raw 24 bit data out, JpegAGA is doing rather a lot of
>processing, of which a HAM conversion is only a minor part.

Now what else does it do that DJpeg doesn't do?

>It also has
>to organise the data in a form suitable for displaying on the Amigas
>planar screen

Which I would count as part of the HAM8 conversion. I mean, we are talking
about the time it takes from knowing what we want to display (the 24 bit
image) to displaying it...

>>So why *did* you (was it you? I assume so, you deleted the attribution :-( )
>>quote the "aspect ratio" of the PC's textmode?!?

>Because you wanted to know what use such an aspect ratio was to anyone.

Actually, it wasn't me :-)
But I'd still say that comparing the aspect ratio of character cells
(which are in turn made up from many many pixels) to the aspect ratio
of pixels is plain stupid.

>Some things require them (or are made significantly easier by their presence),
>yes, but in a large number of cases, no-one could really care less about the
>pixel aspect ratio. So, I ask you, why not use non-square aspect ratios?

Well, I for one prefer it when a horizontal line is exactly as thick as
a vertical line.....

>>>It's by making efficient use of that bandwidth (such as
>>>HAM, interlaced displays, etc) that the Amiga manages to attain the performance
>>>it deos despite it's modest graphics bandwidth.
>>
>>The resolution/framerate combinations it achieves are still pretty
>>unimpressive...

>Am I to take it that you have not seen a HAM8 CDXL animation then?

What does an animation have to do with the framerate of a video mode
(a refresh rate, if you want to call it like that). If the bloody thing
makes efficient use of its limited bandwidth, and still has trouble
displaying any reasonable resolution with more than 60Hz vertical
refresh, this says something about the limitedness of the bandwidth, right?

>>No, I am not. It helps to read what the other one has written, you know?

>frame, the eye sees those, as long as they do not contrast too highly with
>the line that has not been displayed. The eye is generally a lot better at
>seeing what is there, rather than what is not.

Are you plain stupid, or do you do this on purpose? Can you read the words
"thin horizontal lines"? Can you imagine what kind of contrast a thin
horizontal line normally has to the surrounding lines?

>Can I ask if you ever watch
>television? Notice that whilst watching a TV picure at 50 (or 60)Hz interlaced,
>one normally finds it very hard to percieve the flicker,

You may ask me, no problem. My answer would be "have you ever watched
tennis, or socker? You get wonderful horizontal lines in there, and boy,
do they flicker!"

>Your argument has 2 major flaws:

>1) You seem to be equating interlaced displays with low frequency refreshes.
>This is probably, I would guess, because all, or the majority, of interlaced
>displays you have seen have been television type displays.

Nonsense! I have seen quite a few interlaced computer screens, running
at all kinds of frequencies. The reason I equate interlaced with low
refresh rates is that I normally do have thin horizontal lines on the
screen, in drawings as well as in my text (I normally use rather thin
fonts, both the font used in my xterms and the one used in emacs have
one pixel wide lines).

Ah, btw: My TV displays non-interlaced, it has a deinterlacer :-)

>2) You are equating image flicker with raster flicker. Again, a common mistake
>that whilst intuitive, has no basis in fact

I equate the flicker of what I see with the flicker of what I see. In my
case, every horizontal line flickers on a interlaced display, and this is
very disturbing (I won't say anything about the background patterns X likes
to use, other than without changing those, you really learn how bad
interlaced displays are!).

>>I *do* know, and when I wrote this I knew I stepped on thin ice. I just
>>thought it was worth making clear that "newer technologies" referred to
>>the beginning of the century and had absolutely nothing to do with
>>computers or the displaying of text.....

>It has everything to do with it, since computer displays are still relying
>on exactly these two display technologies, practcally in their original form.

While exploring completely new frequency ranges..... And while using the
same technologies to display inherently different kinds of images, which
makes the results from television research a bit hard to transfer....

You have one the '100Hz flickerfree sets'?

I _think_ these sets are interlaced, they just run at a vertical sync
of 100Hz which works to minimise the flicker.

ie 100Hz interlaced ~= 50Hz non-interlaced.

Over most of the year, yes. At XMas with the big releases the consoles
sell more software but for the rest of the year Amiga games software outsells
megadrive and SNES (and PC) quite easily.

Rod McCall (rmccall@mcs.dundee.ac.uk) wrote:
: I bought a second hand F030/4/65 some months ago... I am just a little
: disappointed. Here is a short list :

: Graphics Redraw:- this is a crime and still is. Why should I have to spend
: #30 to get it up to scrath.

Very True.

: Lack of CLI:- I was amazed that no CLI or shell window was provided.
: Lets face it a CLI may not be very user friendly but without
: it a system is near useless. Take the Amiga, it has a
: (not too friendly) but fast CLI, which take me on to my
: next point.

There are plenty of good ones out there and for the average user a GUI like
GEM is going to be fine and they will never want for a CLI.

: TOSWIN:- Although this is not strictly supplied with the machine it is
: apparently faster than the one supplied by Atari. It too is
: extremely slow. It is so bad that the characters are printed
: one at a time!!! This is DREADFULL.

Yeah they are both a little slow...I use Miniwin (the one that comes with
MultiTOS) mainly because it is smaller and I only usually have one TOS prog
in a window so its running each time a TTP or TOS prog is started is not a
problem. Surely this should have been done like TOSWIN with a client-server
suite!

: File_Names: Yes, we are still restricted to the 8.3 format.

If you are using MiNT then install Minix partitions, they are faster and allow
larger filenames. Beware that most standard programs get upset by longer
filenames however.

: MultiTasking:- In two forms: Co-op : this is very fast but the
: interface is awful!!! You cannot for
: example simply iconify a progam and switch
: back to it later.

: pre-emptive: well MiNT is OK, if a little
: buggy, but is also quite sluggish. My old
: Amiga 600 managed better!!!

Why not try Geneva or MagiC then? I have heard good things about both.

: TOS:- The version I have 4.01 is full of bugs!!

Yeah I wish I had 4.04 too!

Michael

! Ricardo Hernandez wrote:
! : You are forgetting though, the Falcon is more expensive.
!
! To which Richard Davey replied
! WAS more expensive. It ain't any more.

Seriously, what *are* the relative prices now ?

Breakdown of 4Mb Falcon costs, as *I* would buy it:

1 Mb 0HD Falcon 399 (Silica)
Simm Socket adaptor 49 (Systems Solutions)
4 Mb Simms 110 (Anywhere)
SCSI drive (say 170Mb external) 270 (Gasteiner)
---
828

or replace the external with an internal 2.5" drive and save 31 lbs
-> 797 lbs. (Again, Gasteiner).

I haven't exactly "shopped around" to get those prices. Just 5 mins
flicking through a recent ST magazine. I dare say the disk could be
done cheaper, and possibly the memory too.

What would the comparative a1200 cost ?

ATB,
Simon.

No - thats wrong. I've seen Atari badged MultiSync's for use with the TT or
Falcon. And I assure you that they weren't low res.....

Craig.

More complicated, but can be done using a careful choice of colour palette
and scrolling different bit planes at differing rates. If you want a true
colour display, then you can use the overlay bit to combine screens.

That would be WW2.0. That version is outdated. The current version is 3.0b, and is a complete re-write.

AmigaDOS 3.0 is designed to be run from a hard drive. If your friend can't afford one, then that's unfortunate, but that's life. Would you try and run, say, UNIX/X from a single floppy?

>
> So what? Does that mean that it magically needs to write several Megs of data?
> The answer is no; The resulting HAM8 image is still only 3/8 MB big.

No, it means that instead of copying data all at once, in 32 bit chunks, catching the CHIP RAM on adjacent available cycles, you miss cycles, write less data at once, etc.

> >No doubt it would be significantly faster if
> >it did render into FAST RAM first. It would also use twice as much memory.
> >DJpeg was writing raw 24 bit data out, JpegAGA is doing rather a lot of
> >processing, of which a HAM conversion is only a minor part.
>
> Now what else does it do that DJpeg doesn't do?

It writes a bitmap into low bandwidth memory, opens it's own screen, creates a message port that listens for the user clicking the right mouse button in the screen to abort the display, does significant amounts of chunky to planar conversion, reduces the data from 24 bits per pixel to 18 bits per pixel, oh, and it converts the data to HAM as well. Now consider what this involves, take previous colour, if the next colour is the same, or differs by one gun, then modify to that colour, if not, see if it, or a colour very close to it is in the base palette, if neither of these hold (rare case, but it does occasionally happen) then modify to a close colour. Now if you're telling me you can't code a routine that does that in a time that is negligible compared to, say, the time taken to decode the jpeg and convert your data to a planar format (having an 8 bit chunky screen would help on these occasions, but AGA doesn't have one, so...) then you'll forgive me for not placing a lot of store by your coding ability.

>
> >It also has
> >to organise the data in a form suitable for displaying on the Amigas
> >planar screen
>
> Which I would count as part of the HAM8 conversion.

Then you haven't got a clue what you're blabbering about. Using, say, a 256 colour register mode (which takes much longer than HAM because it requires vast amounts of dithering to look anything like decent wityh 24 bit files), one still has to arrange the data in planar format for writing to the screen. How can something that is, as you seem to be saying, a necessary step purely as a consequence of using HAM mode apply to every other screenmode too?

> I mean, we are talking
> about the time it takes from knowing what we want to display (the 24 bit
> image) to displaying it...

No, we're talking about the time it takes to go from a highly compressed data format (jpeg) to a displayable image. JpegAGA does not, as I have constantly pointed out, and as you seem to be incapable of understanding, keep a 24 bit representation of the jpeg in memory. That's everything from jpeg decoding, 24-18 bit conversion, conversion to HAM, conversion into planar data (Ever writen code to do that? I have.) and writing the thing to the screen. BTW, I'm sure you, being so knoweledgable about all of this can instantly see why it's preferable to do the HAM conversion BEFORE doing the c2p, it seems perfectly obvious to me.

> >>So why *did* you (was it you? I assume so, you deleted the attribution :-( )

Fine, in 1280*512 draw your vertical lines 2 pixels wide.

> Are you plain stupid, or do you do this on purpose? Can you read the words
> "thin horizontal lines"? Can you imagine what kind of contrast a thin
> horizontal line normally has to the surrounding lines?

Oh, sorry, at the sort of resoloutions I'm used to using, 3-4 scanlines is still thin. I also don't tend to spend my time drawing one pixel high horizontal white lines on a black background, since I generally have better things to do, and, of course, if the lines are not nearly so contrasting (again, as I'm used to, not generally working in less than 32 colours on the Workbench) as black and white ones, then it's not a problem, is it? I run my monitor with the contrast turned all the way to the top, in an 81Hz interlaced screenmode. Any localised flicker is barely percievable, and I'm someone who gets annoyed by 60Hz non-laced displays. I assure you, if it bothered me in the slightest, I would immediatley drop to 640*480. It doesn't, so I don't.

> You may ask me, no problem. My answer would be "have you ever watched
> tennis, or socker? You get wonderful horizontal lines in there, and boy,
> do they flicker!"

Can't say I ever really noticed. Perhaps your TV is a bit poorly?

> >Your argument has 2 major flaws:
>
> >1) You seem to be equating interlaced displays with low frequency refreshes.
> >This is probably, I would guess, because all, or the majority, of interlaced
> >displays you have seen have been television type displays.

> (I normally use rather thin

Likewise, can't say it's a problem.

> Ah, btw: My TV displays non-interlaced, it has a deinterlacer :-)
>
> >2) You are equating image flicker with raster flicker. Again, a common mistake
> >that whilst intuitive, has no basis in fact
>

> I equate the flicker of what I see with the flicker of what I see. In my

Now I'm really confused. Your computer screen is non-interlaced, your TV screen is non-interlaced, and yet you keep going on about all of these terrible interlaced displays around you. This X-terminal I'm using right now is non-interlaced, and, quite frankly, I'd prefer if they interlaced it at twice the frequency, because it really gets annoying after a while.

> case, every horizontal line flickers on a interlaced display, and this is

Every pixel flickers on every type of electron gun display ever invented, it's just that interlaced displays tend to be less prone to percieveable flicker than non-interlaced ones, and that's why they were invented.

> very disturbing (I won't say anything about the background patterns X likes
> to use, other than without changing those, you really learn how bad
> interlaced displays are!).

You keep saying this, yet you are unable to give any evidence why interlaced displays are 'bad'. Are you seriously saying, that at a constant rate of sending pixels to the screen, an interlaced display will not look better than a non-interlaced one? If you are, then I'm afraid I really can't believe that you have given this any thought at all.

> >It has everything to do with it, since computer displays are still relying
> >on exactly these two display technologies, practcally in their original form.
>
> While exploring completely new frequency ranges..... And while using the

The fact that interlaced displays give less visible flicker than non-interlaced displays at the same display bandwidth, and same resoloution is independent of the refresh rate. I challenge you to try and dispute that, because it happens to be a fact.

> same technologies to display inherently different kinds of images, which
> makes the results from television research a bit hard to transfer....

Hardly, since the advent of 'Multimedia' (I hate that word) and graphical user interfaces, computer displays are getting closer and closer to the sort of images TV's are used to displaying. Computer displays still do display a lot of text, yes, and text is more prone to image flicker than, say a photograph. I ask you though, would you rather have a 1600*1200 non-interlaced display at n Hz, where the whole screen gives noticible flicker, or a 1600*1200 interlaced display at 2n Hz, where a tiny proportion of it may have noticible flicker?

Not much, it just saves you a couple of shift operations. It's a lot less useful than full floating point.

I guess that it depends on the model and how much memory is installed.
I've been told that the Mac goes through a process of testing all the
memory or some such thing when turned on. I've used '030 based Macs with
around 20 meg of RAM that take considerably more than two minutes to
finish booting (I'm thinking of various Mac II-type models). My own
experience has been very similar to this guy's when using many Macs or
when using Windoze on a 386 or slower 486.

: ---
: 828

You could take this down a hundred notes by purchasing from Gasteiner.
Which brings it into the 700 price range. You can buy a 2.5" IDE for 295
UKP (that's a 470 meg drive). We could go on adding extra's all day long
if we wanted but for a base machine like you describe above I'll agree,
but remember to slice a hundred notes from that total.

: do real-time animation in at least the Falcon's 16-bit color in 320x200 + overscan?

OverScan by the German company Overlay will do a _lot_ of multimedia
effects including sound/music integration, graphics manipulation (in real
time), scroll texts, etc... it is quite a versatile little tool.

: (that's 30 frames per second)? Purchasing an accelerator is ok, but does that
: software exists?

An accelerator to accelerate what? there is the Eagle Sonic board which
pumps it up to 32MHz, there are also MPEG cards, but please be more specific.

: Any decent 3d animation software for the Falcon that can output in 24-bit
: frames?

I believe the Xenomorph 2 and Cyber Studio combination will certainly do
what you require, the output is 24-bit TARGA format files (around 900K
per picture I might add) and it can handle animations quite well. For
animation away from the 3D field the Apex Media programs are quite
unmatchable. Read the press releases posted in comp.sys.atari.st if you
want to know more.

: Any decent ImageProcessing program with batch file processing?

Image processing, certainly there are lots of packages that can do this,
Chagall, Studio Photo, True Paint, DA's Paint, Rainbow, Gemview. As for
batch file processing I couldn't say, but I wouldn't rule out the
possibility.

: I am taling commercial quality, not just PD stuff...

So am I.

> flicking through a recent ST magazine. I dare say the disk could be
> done cheaper, and possibly the memory too.

> What would the comparative a1200 cost ?

OK,

A1200 2Mb 0HD 270 (various mail order companies, 300 Silica)
4Mb RAM card with SIMM 150 (various)
130mb 2.5" IDE HD 210 (various)

630

but for more power I would recommend:

A1200 2Mb 0HD 270
Viper 28Mhz 030 150 (Power computing)
4Mb SIMM 120
SCSI-II i/f 80 (power computing)
130Mb 2.%" IDE HD 210

830

(for more numerical power you can get a 25Mhz 030 for 50 quid
and clock it to 28Mhz in the Viper board
If you don't plan on adding SCSI drives or devices in the near future
then you can save on buying the SCSI port till you need it)

And the Falcon gets none at all.

BTW, I also appreciate arcade style games like Zool 2, Ruff'n'Tumble,
Jungle Strike, Putty Squad, Cannon Fodder 2 etc. Thats what I like about
amiga games - it can do superb console style games much better than the
PC ever will but it can also handle the big PC strategy games given
enough processor and ram/HD space. So could the Falcon of coursem
but nobody bothers converting stuff for it....

Er, no, I think you have misunderstood the question :)

They were asking if you could sit AT HOME and PHONE a university computer
to get access to the internet (and therefore www) WITHOUT having an
account on the university machine you are phoning.

At least that's how I understood it...
The answer as far as I know is you can't.

If you *DO* have an account on a machine which has internet access and you
can log on to it by phoning up then yes you can.
And of course once you can log onto one machine you can access all the
others using www (with Mosaic).

They were originally saying that there were no "Web Providers" in
Europe. When Chris said "Eh? We have a WWW page here," they replied
"But can I dial it up and access it?"

Gosh, no. They are expensive :-)

What I have is a real de-interlacer card which is fed the video signal
from the VCR and then displays it on my monitor, at 50Hz non-interlaced.
A good thing for a student with limited space and a large computer
collection :-)

From: sinclair@ins.infonet.net
Message-ID: <37k2ta$ob1@insosf1.infonet.net>
Source record: 15292

Atari had a sale of the LYNX II at $49.95 plus $4.95 shipping directly from Atari. Since I had the original and wanted a second just in case the old one went kaput. I called Atari's 800 number and ordered one on October 6 and received it today on the 13th. In the shipping package contained literature on the Jagflop and assorted accesories such as a Jagflop coffe mug, t-shirt, pens and carrying case.

If Atari wants the Jagflop to have a chance in the marketplace, a price reduction is needed. Atari needs to bring the price down to $150 at cost or little profit and make the money on the game cartridges..

Well, I was at work but a friend says he saw DOOM on the Jaguar on
the UK tv show 'Bad Influence'. He owns a 486/66 but he says he was
very impressed with the Jaguar version - smoother and possibly more
colourful than on his machine (which runs a very smooth game indeed).

Same for the Falcon. Although there isn't that much difference in price
between SCSI disks and IDE disks now though.

>> So if you can't afford to buy a HD you are stick with an OS that is very
>> very unfriendly to use (insert disk x, insert disk x... etc etc etc), at
>> least with any ST/E/FALCON the OS is there, ready to use and lets you
>> access the base essential functions of your computer.

This has just reminded me!
I was round a friend of mine's once. He has a A600. All he wanted to do
was copy a few files from one disk to another. I wanted to play Syndicate
but I thought it wouldn't take very long, so I let him do it..
I am glad I did let him do it now because I was rolling around on the
floor laughing!!!

He typed in something along the lines of copy such and such from here to
there. It then asked him for a different disk, so it could understand the
copy command. Then it asked him for the original disk, then the disk to
copy the files to, then the first disk to get back to the prompt. Then
came dir. Another disk swap to understand the command, plus another to
put the disk in he wanted to look at, then the command disk to get back
to the prompt.

I'm sorry, I just found it amazingly funny that it took around 5 minutes
to copy a few files between floppies and check they were in the right
place!!!

BTW this is not meant as a flame, "amigas are crap" post etc. It's just
something very funny that happened to me!

: sell more software but for the rest of the year Amiga games software outsells
: megadrive and SNES (and PC) quite easily.

I must admit that's very interesting, can you back this up with any
statistics though? I am not doubting you, just need a bit more
information to go on before I make judgement.

I personally would have thought PC software would far outsell Amiga
titles, not because it is any better but simply because there are quite a
few more PC's in use than Amigas.

Unfortunate? That doesn't help his situation much, when you buy a home
computer you don't have to expect to spend and spend and spend to get it
to perform basic functions such as WP, yet this is what you are suggesting.
I doubt if you could buy a Unix/X without a hard drive though, so its
kind of an irrelevant statement.

Yes well PC's are in a class of their own arn't they!

: Now a question for Falcon owners - on my old 130ST (yes, 130ST, let's not
: have this argument again) if I didn't put a disk in the drive, I'd get the
: oh-so-lovely GEM after about 30 seconds - does the Falcon do this, and did
: they speed it up any? (The delay, not the machine. :)

A Falcon without a disk will boot from the hard drive, if you have no
hard drive and no disk inserted (then you're a bit dumb) it takes about
30 seconds before GEM kicks in, that's time for you to rumage around and
find a disk I guess, after all why you'd want to do this is beyond me.

The Falcon boot ups, does a memory check (which can be skipped), checks
for an IDE then checks if there is anything hanging off the SCSI-II port
then starts processing the contents of the AUTO folder. The whole
process takes about 3-4 seconds depending on if you skip the memory check
or not.

It was a hypothetical situation proving that an Amiga with no disks is
dead but you can still use an Atari. I was thinking back to times when
you walked into a Department store (one of the more lame ones) and they
had the computer and no software on it, no hard drive in it and one of
those metal locks in the disk drive. They managed to show me Desktop on
the ST (this was back a fair few years) but nothing on the Amiga. Sure
its the shops fault (it was Debenhams btw) but still proves a point.

I'm not convinced there are that many applications where a 48bit fixed
point number isn't accurate enough. Even raytracers have (allegedly)
been ported, specifically POV, although I've yet to get my hands on it.

>keep saying, a serious machine and not something little Jonny asks for
>for Christmas.

"Choose your weapon" would be a phrase to use here.

"Little Johnny" is unlikely to ask for a Falcon for Xmas because

A) It`s more likely that he`ll want something to play games on
B) His friends are more likely to have one
C) He can buy software for it in most shops stocking computer software
on the High Street
D) He has almost a dozen computer mags to pick from from the newsagents
no matter which computer he picks other than the Atari range.
E) What use are a DSP, SCSI-II and a hard drive?

The Falcon isn`t a bad computer, it`s just far to niche to be anything
sucessful.

There are a number of things that the Amiga could learn from with regard
to the Falcon. Namely, DSP, SCSI-II and SIMM sockets as standard would be
nice. MIDI is already there on the Amiga. It comes straight out the serial
port, just stick it into a MIDI port box and there you go. In a similar
way, the Falcon could learn a few things from the Amiga too (memory
architecture, OS, custom hardware, cost)

The overiding principle here though is cost. The A1200 is a very cheap
computer that anyone can buy with a few months wages to play around on.

This is how a lot of "Little Johnnies" or "Little Marys" get into
computing. ie. Kid nags parent to buy a megadrive/snes, Parent thinks
that a computer would be a much better idea with the false opinion that
computers are educational and may help the kids future boring career.

I know this because I would bet that most of todays 20-25 year old
programmers fit into this category. Myself included!

The A1200 isn`t that much more expensive than a console in comparison
with the PC so is the logical step for parents. Only a rich, foolish
parent would spend a 1000 quid on a pc/falcon/mac on the off chance that
it wasn`t just a passing fad.

This is why of course that the Amiga is sucessful in the UK whereas not so in the US. Parents aren`t as rich! (sweeping statement I know)

If we`d seen all of the proposed "A3000 plus" machines features in the A4000, The Amiga would have AT&T DSP and SCSI-II as standard way before the Falcon. As usual, the short sighted CBM management went for reducing cost on the high end machines to maximise profit per unit. The arguement over Falcon vs Amiga would have been a complete non arguement on solely techincal grounds if we had A3000+ machines.

If we ever see an A1400 (or whatever), I`d like to see DSP, SCSI-II and SIMM sockets in there. Space for a 3.5 inch HD would be nice too. Oh, it has to be an 030 as standard too with a simple way to replace the processor so you could buy it at various speeds.

Not really much you can say to that is there!!!

>The overiding principle here though is cost. The A1200 is a very cheap
>computer that anyone can buy with a few months wages to play around on.

Seriously, you can get either a Falcon or an A1200 very cheap (around 300
pounds for either). The trouble is both machines at this price still need
a lot of extras to make them really worthwhile. Extra memory and a hard
drive for both. For the Falcon, you ideally need a VGA or multisync
monitor plus either Blowup or Screenblaster, in order to get a decent
resolution. NVDI, Speedogdos and a few other things come in quite useful
as well. I don't know too much about the Amiga myself so I can't comment
on that.

Basically, no machine is perfect and there will always be better ways of
doing things. You just have to make do with your personal favourite
whatever that may be. Also different machines are good at different tasks
so it depends on what you want to do with the machine as well.

G MORAN (moran@bires052) wrote:

: Actually, any machine with bitplane graphics can do parallax - the more
: bitplanes, the more colours/layers.

True. But things are a lot simpler on the Amiga (for simpler read easier on the CPU). Imagine two screen layers each of 16 colours = 2*4 bitplanes, to scroll these at bitplane level requires bitwise manipulation of 8 areas of memory. Plus the fact that you still need to address the problem of overlaying your two screens as discussed in my original post.

Scrolling on the Amiga would not be achieved in the same way. The bitmaps exist in memory in the same way, but bitwise manipulation does not occur because rather than scrolling the bitmap data and then displaying it to the screen the Amiga scrolls the screen window over the data, which defines a screen that is bigger than the window. The actual graphics data is only updated when the window reaches the edge of the data. This involves blocks of data and is performed by the blitter; again much faster than scrolling the data itself. As the screen window is already defined as displaying one screen on top of the other (Dual Playfield) you don't need to worry about combining your two screens.

The result is extremely fast and smooth scrolling - even with multi-layered screens. Even if you throw a PowerPC or Pentium at the problem you still wouldn't achieve Amiga performance in this area. After all the Amiga was *designed* to be a great games machine. The fact that it's also a damn fine home computer is an added bonus.

You're one of those guys who still thinks Doom on the PC is the ultimate game aren't you?(although it is quite fun) Not only are you wrong about Atari but i own a PowerMac and there are quite a few good games coming out for it soon. Ever hear of Marathon from Reality Bytes? From what i've heard (and seen), this game should knock the socks off Doom (and DoomII). I've owned quite a few powerful PCs and quite frankly, the games may be many, but not many are really that good- but you probably get a kick out of Windoze too. Are you still waiting for the Pentium overdrive chip to come out so your investment in that 'upgradeable' motherboard wont be a waste? Or are you too busy trying to figure out what IRQ to set your soundcard to so it will work while you play on the modem? HA! Oh - and the Jaguar rules.

That isn`t how it works. You normally have an internet provider such as
Demon which you dial up on the modem. From there you connect to the
internet. How Demon gets to various Universities or other sites is up
to them. If you had to phone up each site directly, you would have a
huge phone bill!

>The only web providers I personally know of are very PC orientated and
^^^^^^^^^^^^
No such thing. You have an Internet provider who provides access to the
Internet. They provide you with services such as mail, news and ftp. The
World Wide Web is just a subset of sites on the Internet that have html
(hypertext) files on which you access through Mosaic. Currently Mosaic
runs on Macs, Windows, X and Amigas. Obviously there isn`t a Falcon
version as you would know about it?

>they charge amazing amounts of money which, considering how slow web can
>be sometimes, is a bit off really.

Get hold of the "Big Dummies Guide to the Internet", available in formats
that most (probably not the Falcon) machines understand.

I agree about the Falcon borrowing Amiga OS ideas, but whereas your Amiga would only need a few modifications to handle new ports such as SCSI-II, a DSP chip and even MIDI if required, it would take a whole re-write of the Falcon OS and major problems with the software already existing if we were to change at this late stage in the Atari's development cycle. This doesn't mean is shouldn't be done, it just means the chances of it happening are as likely as seeing Nintendo's new console this side of 1995.

However, it's "Windows 95" not "WINDOWS95".

Actually, people on the Net such as Richard have suggested that
there are 120,000 Falcons out there. This is certainly not
enough for a large company to produce softs for it, but it is
enough to make it worthwhile for small companies and shareware
authors (and they are beginning to untap the Falc's power).
Falcon development is increasing quite a bit, it seems.

Yes, a one disk drive Amiga is abysmal to use. When I had
an Amiga 500 I got so sick and tired of swapping disks!
This is why I switched to the ST. No disk swapping at all
for formatting. For someone who can only afford a computer
with a single disk drive, they should definitely choose an
ST over an Amiga if they do not want to become incredibly
frustrated. However, these users constitute a small number
of people, I'd imagine.

If your friend wanted a machine where he could just turn it on and easilly
word process without a harddisk, may I reccomend the Commodore Plus 4.
The usefull facilities provided by a modern OS will no-longer fit on a single
floppy. The Amiga does better than most, in that you can do a stripped down
WB that will fit on a single floppy, and then run it from RAM to reduce
disk swaps, but that's an inneficient soloution. The correct soloution is to
buy a harddisk. We aren't working with Spectrums and C64's anymore, which is
something you'll just have to live with, I'm afraid.

Does it run under linux68k? That would really be nice!

If so, which affordable Amiga models do have an MMU?

Midi interfaces have never cost an arm and a leg. They are like less
than $50 for just about any platform. Builtin MIDI isn't really all it
is cracked up to be.

You make it sound as though since the Amiga has no builtin midi that it
doesn't have any midi interfaces or midi software available for it, which
would be false. Now, circa the mid 80s, there was probably far more MIDi
software written for the Atari, but I don't think that there is much
going on now, whereas the larger userbase the Amiga enjoyed until
recently has allowed more current software to be written (Bars and Pipes
for instance).

>If so, which affordable Amiga models do have an MMU?

My A2000s both have MMU(030 and 040 accelerated), 3000 has built-in, as does
4000/040. Cheapest way to get MMU'd Amigas is to buy a low-end machine that
has been accelerated. A1200 with 030 would be nice, but to use DaggeX in > 2
colors, you should get a 2000/030'd with graphics card, or 3000 with graphics
card. I think DaggeX only supports the Picasso, but I don't know, as I don't
deal with it much, and don't have a graphics card(yet).

: Tis I find rather hard to believe, have you actually SEEN either of these two
: packages?

I've seen both. I'm not sure that I would class Atari Works as a _good_
WP, but it's competent, produces nice output (in common with everything
that uses Speedo) and does what I want it to do. It is however a bit
short on some of the more complex layout features.

Papyrus is impressive, and is on a par with any other WP I've seen.

: > wp on Word Worth (which he got with his miggy) for some school work and
: That would be WW2.0. That version is outdated. The current version is 3.0b, and
: is a complete re-write.

This is all a bit silly. The nicest OS is, in anyone's opinion, the one
they are used to.

I've got a 25MHz 68882 in my Falcon as well, so I'm not biased. I've got
a mandelbrot program which uses both, and using the DSP it's about 4 or 5
times as fast as the FPU. There is floating point source for the DSP
which gives at least 2.5 times the performance of the FPU. And you can
run this in parallel with the 68882.

Was ist eigentlich TelefonSEX ??

Bis zu meinem 33.Lebensjahr dachte ich Telefonsex ist wenn man mit einem Telefon ins Bett geht und dieses l�sternd streichelt oder voller Begierde mit der Zunge den H�rer ableckt.
Ich konnte nie verstehen was Leute daran finden k�nnen mit einem Telekom-Fernsprechger�t ins Bett zu gehen.

Sp�ter erfuhr ich dann das es den Leuten nicht um Sex mit dem Telefonapparat sondern um sogenannte obsz�ne Anrufe ging.
Also nahm ich mein Telefon mit ins Bett und wartete und wartete und wartete.
Aber keiner bzw. keine rief an.
OK dachte ich, don't call me, I call you !! Gesagt getan.....So begann ich splitterfasernackt auf meinem Telefon irgendwelche Rufnummern zu callen.

Ich tat das jedoch nicht mit dem Finger oder mit dem Zeh sondern mit dem Penis.Dieses gestaltete sich �usserst schwierig da ich kein Tastentelefon besitze.
Nun will ich jedoch nicht weiter um die hei�en, scharfen, geilen und feuchten Brei herumreden sondern gleich zur Sache kommen:

Ich w�hlte also die Nummer 00592-240083 und hatte mich eigentlich verw�hlt.
Nun hatte ich eine Frau an der Strippe die strippte und als ich ihr sagte "Oh Entschuldigung ich habe mich verw�hlt" erwiederte sie "Ach darauf stehst Du also.....Ich habe mich verw�hlt.....Ich habe mich verw�hlt".
Ja, dabei wird jede Telefonstrippe zur "Stand-Leitung" !!

Danach brauchte ich noch etliche Telefonate zum einmaligen Billigpreis von nur DM 3,12 in der Minute um dieses Mi�verst�ndnis aufzukl�ren was mir eine Telefonrechnung von fast dreitausend Mark einbrachte.
Nur die Telekom wei� wahrscheinlich wieviele Sex-Telefoneinheiten das sind.

Na und um diese Rechnung nun auch bezahlen zu k�nnen mache ich hier bei mir im �rtlichen Pfarramt jetzt einen kleinen Nebenjob:

```
Rrrring....."Erotische Telefonzentrale guten Tag.......Ach Sie sinds Herr
Bischoff.......Nein, das war nur ein Witz lieber Bischoff"
"Was soll ich? Ihnen den Hechler machen ??....Pieps Pieps!"
```

Und wer das ganze LIVE und in voller L�nge erleben will ruft einfach Tag und Nacht folgende Telefonnummer an: 00592-240083 !!
Am Anfang wirst Du dann nach einem pers�nlichen Pin-Code gefragt den Du mit einem normalen W�hlscheibentelefon oder auch mit einem Piepser eingeben kannst um Dein pers�nliches Erlebnis zu w�hlen.Hier die Pin-Codes:

I'd like to see that. Wordworth III (no s) and FC II are VERY capable packages,
Wordworth (which I use) has lots of very nice features, such as table support,
the ability to do all sorts of interesting things to text (right upto wrapping
it round spirals and adding drop shaodws, although it can be used to just
rotate it, of course :-)), a whole host of drawing tools, all the usual text
frame stuff, contents and index generation, footnotes, headers, footers, etc
etc.

> can use Adobe Type 1 fonts as well as True Type. What types
>of fonts do your progs use?

AGFA Compugraphic, Adobe Type 1, True Type, Amiga bitmap, Amiga Colorfonts
and printer internal fonts.

>Also, are there low cost word processors for the Ami? When I

Loads. Final Copy II is quite good value right now.

>had an Amiga 500 I could not find any PD editors or low cost
>commercial options (well, I did ask my Amiga dealer for advice).

I can't imagine you looked very hard, check out your local PD library or
ftp to wuarchive.wustl.edu, or alternativley, pick up a current Amiga magazine,
many have given away full word processing pacakages in the past.

>Has this situation changed at all? For the Atari, people on
>a tight budget have loads of good editors to choose from in
>the public domain and commercial world.

So does the Amiga, I can't imagine why you think otherwise.

Figures were from ELSPA. They were in most of the Amiga mags.

> I personally would have thought PC software would far outsell Amiga
> titles, not because it is any better but simply because there are quite a
> few more PC's in use than Amigas.

More PCs in use - yes. But many PCs are in businesses. Plus theres an
INCREDIBLY high level of PC software piracy. Still, companies make games for
PCs since they consider it the largest potential market.

Forget Slime World - its absolutely CRAP. I got it after seeing mucho hype in the mags and was totally dissapointed. It might be better with a lynx-up though.

Chris,
I sure hope that you are not implying that the Atari programs I listed are not capable. They are very capable, indeed. I do not have my trusty issue of ST Informer with me that gives off its features, but, again, I would tend to believe that it can keep up with any WP on the Amiga. For most users, AtariWorks is more than enough. I love this program. The output is incredible to my Canon BJ-5.
As far as not being able to find a low cost WP for the Amiga a few years ago: it was a few years ago. It may have changed. I had no access to the Net (not everyone does, you know) and my dealer could not recommend anything. He looked through Fred Fish but could not locate anything. Maybe he was incompetent. Who knows? In Amiga World the ads usually listed Final Copy II or something in its price range. There didn't seem to be low cost alternatives like Marcel on the Atari or ST Writer. Also, in the States, magazines tend not to have cover disks.

> Maybe it's because of the commonly held view that computers are the
> tools of the Devil.

"Commonly held" by whom? Anyway, given the assumptions that the Devil does exist and is the evil and malicious entity that the standard religious propaganda (known as "The Bible") says he is:

I would expect that this Devil would want people as his tools rather than computers, which tend to be completely immobile and can be turned off or unplugged.

> I'm getting worried.

Try reading Robert A. Heinlein's "JOB: A Comedy of Justice" for what appears to be a much more reasonable impression of what Satan is likely to be like. It will probably reassure you.

(Insert smileys where appropriate for the humor-impaired.)

-Chuck

PS: I am using the term "propaganda" deliberately, as the definition in Webster's Ninth New Collegiate Dictionary is wonderfully appropriate. (Go look it up!)

Hey, did you know if you take the UPC symbol and break it down the first digit, middle, and last digit are all 6? On every UPC symbol on any product, the same first, middle, end lines are ALWAYS the same. This is for error checking. Just so happends that these digits are 6.

Look at the fist two lines that extend down to the numbers. The middle is the same and so is the end. In binary, these are six.

(Weird music playing in the background)

Darren

Nope. You can afford the A1200 bare bones if you don't have enough
cash... what happenned with "ATARI's power without the price?" You might
be amazed at how much people can't afford more than $300 US dollars (500 UK
pounds?)

Nope. First you have a "68030SX", second your SCSI II is not a real
SCSII. And if you think that for ray-tracing you don't need a faster
processor, let me tell you I could put right now if it were outside
a PowerPC 620 to its knees. NOpe, I am not kidding. So Imagine
how pathethic a "68030SX" might look like.

BTW, where's the ray-tracing, multimedia software for the Falcon?

: Hey, did you know if you take the UPC symbol and break it down the first
: digit, middle, and last digit are all 6? On every UPC symbol on any
: product, the same first, middle, end lines are ALWAYS the same. This is
: for error checking. Just so happends that these digits are 6.

: Look at the fist two lines that extend down to the numbers. The middle
: is the same and so is the end. In binary, these are six.

: (Weird music playing in the background)

: Darren

That's why I mentioned (in a previous post) the appearance of "696" on
many machine processed bills...apparently this is the one combination
that is practically error-free for determing the position of the stub
when returned.

The new UPC codes also have small barcodes on each side of the main
code. They are marked "H" and "F". I've heard someone suggest that
these mean Hand & Forehead. Hmmmmmm....?

A Secret Service agent recently did a presentation on
anti-counterfeiting methods here at Optical Sciences Center. New
currency is slated to appear in 1996 with several improvements...some of
which sounded very scary (as far as this thread is concerned). However,
I'm not allowed to discuss any of it. :(I can say that $50 and $100 bills
will be introduced first...these are the denominations that hostile foreign
governments prefer to duplicate.

Yup, if your freind hasn't enough dosh to buy a HD for his A1200 or afford
extra memory, at least he has a usable (but at times frustrating) system. Just
how would a Falcon cope without HD or more than the 1 meg which comes in the
lowest config model?

The price of an A1200 is anything from 270 to 300UKP.

: : I'm so glad that you are happy with your non-midi computer, I am happy
: : with my midi computer.

: Midi interfaces have never cost an arm and a leg. They are like less
: than $50 for just about any platform. Builtin MIDI isn't really all it
: is cracked up to be.

: You make it sound as though since the Amiga has no builtin midi that it
: doesn't have any midi interfaces or midi software available for it, which

I don't think that I did. But perhaps I should have said non-midi as standard computer, this is after all .advocacy where syntax is vitally important.

: would be false. Now, circa the mid 80s, there was probably far more MIDi
: software written for the Atari, but I don't think that there is much
: going on now, whereas the larger userbase the Amiga enjoyed until
: recently has allowed more current software to be written (Bars and Pipes
: for instance).

Well kinda, I think that there is a lot going on midi wise for both machines. The poster I was responding too said that many users didn't want midi and so the amiga was ideal since you didn't get it, unless you wanted it. As you so kindly pointed out.

Really midi is just data so any output device that can output data fast enough can be used to output midi, the only benefit of the ST is that since the midi ports come as standard, and they are the standard 5 pin sockets you can slap the instruments straight in. Great for the musician who really just plugs things together and doesn't want the hassle of buying extra bits.

Hell you can plug midi instruments on the back of a spectrum.

I'm still happy with my midi as standard machine and I hope you are happy with you midi as cheap plug on extra which doesn't imply a lack of software or lack of professional users, but neither does having it as standard imply that the software now is crap, machine.

Yours Happily, and with his tongue as far in his cheek as it was in the LAST post.

As far as prices of Amigas compared to Falcons in the US, the
prices are much closer now. And, just try to find a 1200 in
he States. Barely any advertisers in Amiga World list them.
One place was selling an Amiga 1200 2/210 system for $1399,
I believe. This was one of the only places that had them.
With all the extra goodies you get with the Falcon, the Falcon
is a better choice, IMO.
If you want raytracing software why not just flip through the
Toad Computer catalog, Raist? Raystart is $60.00. You can
also get POV on the Net. As far as rendering and image
manipulation you can try Studio Photo, True Image, Chronos 3D,
Phoenix 2, DA's Picture and DA's Photo to name a few. Now,
what was your argument, Raist?

If anyone wanted to run a Falcon with 1 meg of RAM and no
hard drive, that'd be much better than using an Amiga with
he same configuration. Just think of it as a "Super STe."
There would be much, much less disk swapping than with the
Amiga. If someone could not afford a hard drive, they'd best
buy a Falcon. Besides, you get the benefit of high density
disks :-).

Errmmm... what exact planet are you living on???? GEM is a nightmare
compared to windoze and thats being generous.... GEM is not comparable to
WB 1.3. BTW i thought GEM was the GUI... TOS is the OS (hence the name
[Tramiel Operating System])

>|>
>|> : Floppy based? Get real, running any modern OS from floppies is either
>|> : nightmare or impossible.
>|>

First you`re acting like you`re on another planet and now you seem to be
in the dark ages... if your running any modern OS then you should be
running it on any modern computer. Not a ONE floppy based system. (Even
my old ST had 2 floppies:)

Oh and just to put you straight on a few quite major hickups there...
Workbench is NOT the Amiga`s Operating system. It is merely a GUI over
INTUITION.

>|> Falcon Owners Group (UK)

Falcon owners Group... should be a small hall then (for the meetings :)

Uh, Paul, last time I checked people's choice of operating systems is subjective. I started with the Amiga and switched to the Atari because I like the OS/GUI much better and I was using a one disk drive system (the ST is much more usable than the Amiga in this situation.) I would also argue that GEM is much, much better than Windows. Would you rather deal with the Program Manager instead of just popping in a disk and moving files the click and drag way? I would also say that you probably have not seen TOS 4.04. It is very, very nice. Hell, if you really hate GEM, though, you can choose between PD desktops and commercial desktops. I would like to know what your specific complaints are about GEM. The original GEM was very simple and got the job done. The new GEM offers many nice features (drag 'n' drop, launching programs with a keypress, menu selections configurable to a keypress, icons on the desktop, preemptive multitasking with MultiTOS....) How many of these features does Windows offer?

Well, I am glad that you are so certain about the name of the OS
you hate. This topic has been discussed to death and a majority
of people agree that TOS stands for "The Operating System."
"Tramiel Operating System" was a rumor that has caught on. I
will try to find an early source for you if you wish. I believe
that the Byte Magazine article announcing the 1040 ("Power without
the Price") said that TOS was, indeed, "The Operating System."

So? Nothing lasts forever. One day the PC won't have software for it anymore either. Right NOW there is plenty of good software and there will be software for the next year or so. The falcon right now is in the situation that the Amiga will be in in a couple of years.

Could you post double precision whetstone results for the DSP, and I'll do the
same for the '882.

What's your point, Gavan? We all know that the Amiga has lots
of graphics programs. Raist implied that the Falcon had none.
Well, he was wrong and I was correcting him. I was not saying
that the Falcon had superior software in this area. It probably
doesn't, but it does have programs more than adaquate for
an average user.

Actually, Gavan, I believe that people did mention that Mint
ran on a one drive system (am I right guys?) Besides, Geneva
would work (only needs 512K, I think).
Can you format a disk on the Amiga on a one drive system without
swapping disks? (Couldn't on 1.3, this may have changed). BTW,
TOS 1.0 handled this fine.

: Maybe they have better things to do than douse the flames of ignorant
: posters? (that wasn't implying you btw)

Thats not what I'm suggesting rather that they could perhaps put press releases on to the net. If they want to they could also provide information on up and comming new products e.g release dates, prices etc. This would reduce the BS as there would be NO debate as to the accuracy of the reports. It would take them a few minutes each week and perhaps improve public relations a little.

But look at the percentage of Falcon's with HD compared to Amiga's, you state approx. 50% while I state Falcon's being approx. 100%. That is what counts, not numbers, but the nature of the computer set-up users own, it shows their dedication to their computer and in a way how much more serious they are in its use.

Built in MIDI might not be *that* amazing, but it's not just the MIDI ports that made the ST the leading home and indeed professional platform, because they were there from the start, software companies picked up on this and started developing MIDI sequencing software for Atari computers well before the Amiga. This gave time for them to improve and enhance the software over all these years until it has reached the truly professional standards that Cubase Audio 16 is at. Amiga might have had MIDI capabilities, but software designers saw the Atari as being the one to develop for, as a result show me a program as powerful as Cubase Audio 16 on the Amiga?

Well i was browsing through the November AmigaWorld. i came upon this Canadian mailorder that sells everything Amigas. I thought my eyes were decieving me when i saw prices on Amiga systems.. A4000/030 with 200 meg harddisks selling for $1999. This is a machine with a brain dead 030 at 25 mh and did not include a monitor. The 040 version with a 340 meg hd was selling for $2999. You can get a Performa 630 system with monitor, Keyboard, modem/fax, cdrom drive, 8 megs of ram, 250 meg harrdrive and tons o
of software including cdrom ones for $1800. I hope the new amiga owners come to their senses.

The built in midi ports did mean that the ST got the major share of midi development as every ST had the capability. Unfortunately for the Atari, the MAC now has the leading edge in midi despite the lack of proper midi ports on most macs.

The figures were for the first half of 94.

BTW, the figures for ST software sales were LESS THAN those for the c-64.

Yes, and you could do it also on a 1.3 system. Just copy the format
command into RAM disk and do it from there. I can't remember if format
can be made resident, but if so you can install it into ram as a
resident command too.

Of course, its always a good idea to swap any disk that might be in
the drive with your blank disk before formatting.....

Just as well he had the option of buying an A1200 then. A 4 meg/HD falcon
would have meant he could never have got into computing.

> The
> A1200 _has no HD as standard_ why do you deny it? It's a fact! Sure you

Weren't you saying you could get 1 meg/no HD falcons for 400 quid? Then
a hard disk is hardly 'standard' in a Falcon either. Theres no such thing as
a 'standard' PC configuration and the only computer which would have a HD as
'standard' (ie in ALL machines sold) would be the Macintosh.

What counts is the NUMBERS of computers with HDs. I'd say there are MORE
A1200s with HDs than there are Falcons - period.

Thats why more and more games companies are making their games HD installable
on Amiga. Hired Guns springs to mind as a game that really benefits.

4280. Atari has finally died

Newsgroup: comp.sys.atari.advocacy
Date: 1994-10-20 09:49:20 UTC
From: ebulich@uniwa.uwa.edu.au
Message-ID: <385ef0$125@styx.uwa.edu.au>
Source record: 15118

Paragon computers, the last computer store that supported Atari in Western Australia closed its doors a couple of weeks ago. The future for my 2080 STe and my 520STfm is looking pretty dim. I can't believe how atari have let themselves fall by the wayside. In 1988 when i first got my STfm it was streets ahead of the MacPlus i was using at work. If only Atari got away from the games machine image, and marketed the ST's as a serious work machine and offered them at competitve prices to educational institutions and small business, perhaps the future of the ST could have been different.

Regards

Eddy Bulic

Rod,
As far as new computer developments, there are hardly any coming
from Atari so I don't see what they could post. Other 3rd party
developers are usually good about keeping the Net community
informed (Compo, Gribnif and Lexicor, for instance). Also,
the only real press releases Atari is coming out with are Jag-
related and these show up on rec.games.video.atari.

Peter,
You have no idea what you're talking about. Atari will sell all of the projected 200,000 easily. By the time the Sega Saturn and Nintendo Ultra-64 come out, the Jag will have over 30 games, CD-ROM unit, and a decent installed user base. 3DO and Atari have a good chance at having the dominant systems by this time next year. With Doom, AvP, Iron Soldier, Fight for Life, Kasumi Ninja and other games, Atari only needs to keep advertising get the Jag into retailers (TRU is a good start). How can you base a system's success on a slow start when its competitors are nowhere to be seen? Yes, the 3DO is out but there is room for two systems and these systems are aimed at different audiences.

4285. Do not join the Falcon Owners Group

Newsgroup: comp.sys.atari.advocacy
Date: 1994-10-20 18:23:40 UTC
From: S925377@mailserv.cuhk.hk
Message-ID: <S925377.7.0049AD28@mailserv.cuhk.hk>
Source record: 15115

Hello everyone, including Richard Davey of Falcon Owners Group in UK,

I am warning everyone in the atari falcon world not to join the FOG UK.
This is because Mr Richard Davey is not a reponsible person.

I wrote a letter and paid by bank draft to FOG UK to Richard Davey , who is the chairman of FOG, subscribing to falcon update, which at that time, only issue one was out. After a longtime, I still haven't received any magazine and I wrote to FOG UK again, I think this was in late 1993, and then FOG sent me issue 1 and 2 together, without any explaination for the delay. Well at first, I guess may be FOG has not been successfully establised because sale of Falcon was not good in UK. And I waited for months. Then I wrote to Mr Richard Davey, since I read from internet that FOG UK was still here, complaining the delay, asking for reasons, and asking for refund if he can't maintain FOG or if he can't send me magazine. FOG then sent me issue 4, again without explanation for the delay and without issue 3. I read the disk magazine issue4 and I discovered Richard Davey's email address. I sent a email to him, around mid94, mentioning about the above situation, and asking for issue 5 to be sent on time, as Richard Davey stated in issue4 that issue 5 will be out soon. He did reply to me at that time by email, saying that issue 5 will be sent to me soon and he has a problem when sending issue3 with the mailing company and he will explain the situation later. However that is all! No more reply or message or magazine from FOG UK.

I still haven't received any further Falcon update magazine since that time. And about a month ago, I wrote a email to Richard Davey again saying that I still havn't got issue5. And of course, no reply.

I do not always read usenet. But as I am now reading, I see that Mr Richard Davey is still alive, FOG UK is still here, and FOG UK is still recruiting members around the world through internet.

And that falcon update issue7 is going to be out soon.

TO Mr Richard Davey,
I had ordered Falcon update issue 1-6, including the disk softwares, in august 1993. But you have not sent what I have ordered, and what your company, FOG UK promised to send me, which means you have void the contract between your company and me. I did not order overdue magazines, which means all the magazines(issue 1,2,4) you sent to me is not the magazines I have ordered. And I am not supposed to write to you every several months asking for an overdue magazine. FOG UK should have sent me my copy when it was out as I had paid for it. But FOG UK did not do that. And therefore I am now asking for a total refund. You do not have to send me anymore overdue magazines. You have sent me nothing that I have ordered. You have broken our contract and I am entitled to the total refund.

To everyone,
Well, I don't think I am going to sue FOG UK even if they don't give my money back. After all, I don't care too much about that little amount of money. But I reserved my right to do so.

Therefore I would like to warn everyone in the world not to join FOG UK, a group or company that will take your money but will not fulfill their promise, which I consider as irresponsible. It is a shame, not only in the atari world but to the whole mail business in the world ,to have such a "cheat money" group.

If anyone, including Mr Richard Davey of FOG UK, has any response to this letter/mail, please mail to me directly as I don't read usenet often and please send your reply to usenet also to let everyone to know about this, particularly reply from Mr Richard Davey FOG UK.

Yours,
Malcolm Fung,
s925377@mailserv.cuhk.hk

4286. It should be FOG UK not FOG

4289. Atari Future ?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-10-20 19:10:21 UTC
From: tomcattd@cs.tu-berlin.de
Message-ID: <386fat$2lm@news.cs.tu-berlin.de>
Source record: 15165

I'm reading this newsgroup for quite a long time now, I own an Atari Mega ST myself, enjoy working with it and wouldn't dream about selling it. On the other hand, I must admit, that it's kind of outdated and new software is hard to get.
I always considered Atari a bunch of idiots after I discovered what they did to the users. They never developed anything, that would enhance their machines, they always left this to other companies. I still thank them for the non existing memory upgrade ability. Boy was this expensive and awesome to get my one meg up to four.
By now Atari has left us behind no new computers are appearing, no upgrades and definetly no support in any form. So if you bought an Atari stick to yourself or other firms for help but don't bother them.
So they have got htis new play thing: The JAG. Fancy graphics and all the stuff kids dream about but definetly few are buying this and every magazin is doing more hype about Nintendos, Segas and shit to come than about the JAG. No advertising, no keeping of time-announcements, how long do they want to go on like this. Haven't they learned from Commodore ?
What do they want to do to stay alive on the market ? Sell TT's and expensive Falcons (great computer but I don't need a DSP) ?
Why haven't they bought a PowerPC license and build a new generations of Ataris, that would suit us more the PC's ? Have the things build in that Macs don't have : Midi for example. Make it cheaper than Apple and I would very much consider buying one. But I don't think that they will do anything like that. A 68060 is out but is one imagining that Atari will build anything with it ? Other companies have to build them like the Medusa is from a swiss firm. So Atari Company here is my final statement: Shove those JAGs up your a..e, you have done no good for 5 years. Users are not of interest to you, all you want is to make money, no matter how. Get lost and leave those alone who thought they would buy a computer with a great future.

Greetings to all Atari users

Scott, Yes I know what I am talking about. This is the Jags second Christmas
and will do poorly. Atari has lowered sales estimates of the Jagflop twice in
recent months from 500,000 to 200,000. Not a very promising start. People are
still flocking to Nintendos and Segas current offerings and when those two
firms come out with new consoles, the jagflop will be further pushed aside.
What do you mean that 3do and the jagflop are aimed at different audiences?
Care to elaborate. Atari's competitiors are 3do, Sega and Nintendo and so far
Atari has not put a dent in the market..Atari needs to drop their console to
$150 to wet appetites and get noticed..

I understand your frustration with Atari; however, I disagree with
many of your points.
First, yes, the ST is hard to upgrade the memory in. However,
since the ST, the STe came out (a great low-priced computer) which
uses SIMMs and is more easily upgradable.
Also, Atari has been developing new hardware. The Falcon is a very
nice machine as is the TT. TOS 4.04 is great to use, AtariWorks
is nice and SpeedoGDOS is fabulous. Atari _did_ take to long
getting the Falcon to market, though, and by the time they did it
was too late. Atari did, IMO, screw up the computer market. If
they had continiously advertised the STe in Europe and come along
with a lower-priced alternative to the Falcon it would be doing well
over there IMO.
Right now Atari has to go with the Jag. It is there only hope really.
There is no way that Atari can compete with the huge clone makers
on price/performance. They don't have the cash. The computer
market is too cutthroat for small Atari to make it.
The Jag has a chance. It is a wonderful system and Atari has been
pushing it in the States. The big advantage they have is having
got the Jag out before the competition. Whether or not the Jag will
succeed is anyone's guess, though (I think it will, btw.)
So I do agree with some of your statements, but for Atari to start
making computers again instead of the Jag would spell their doom.
If the Jag does well, however, you may just see new Atari computers
(who knows?) Supposedly there already exists an Atari Falcon based
on a Power PC. We can just hope it see light of day. Also hope
that a bigger company decides to make Atari clones so that we
can see low cost machines.
I do agree we have to support the Atari companies such as Compo,
Gribnif, etc. These companies have done a great job supporting
our machines!

Thomas Dassel (tomcattd@cs.tu-berlin.de) wrote:
: firm. So Atari Company here is my final statement: Shove those JAGs up your
: a..e, you have done no good for 5 years. Users are not of interest to you,
: all you want is to make money, no matter how. Get lost and leave those alone
: who thought they would buy a computer with a great future.

Do I detect a whole vineyard of sour grapes here? Atari have a lot to
do, launching a new console into such a turbulant market place is not
something you dive into head-first. They had huge cut-backs, budgetted
well and sorted out their entire operation, the end result is a company
that still exists. Personally so long as they make money I don't care
where it comes from, as long as Atari are alive and kicking Atari owners
everywhere will have a glint of hope in their eye. As soon as Atari fold
and go under, it will be the end as we know it. Which is why I sincerely
hope their Jag sell's by the bucket-load, when this has generated the
income it should maybe we will see a resurgence in the computer areas,
who knows?

Long live Atari.

Distribution:

Pete,

: Scott, Yes I know what I am talking about. This is the Jags second Christ
: and will do poorly. Atari has lowered sales estimates of the Jagflop twice in
: recent months from 500,000 to 200,000. Not a very promising start. People are
: still flocking to Nintendos and Segas current offerings and when those two
: firms come out with new consoles, the jagflop will be further pushed aside.
: What do you mean that 3do and the jagflop are aimed at different audiences?
: Care to elaborate. Atari's competitiors are 3do, Sega and Nintendo and so far
: Atari has not put a dent in the market..Atari needs to drop their console to
: $150 to wet appetites and get noticed..

I agree with you that the Jaguar should be lowered in price ...
epecially since the 3DO came down from $699 to 399. However, I don't
think Atari is dead yet. Yes, the estimates have been lowered, but Atari
can always sell beyond their expectations. Given that Atari recently
received large amounts of cash from Nintendo and Sega, the Jaguar
advertising has been increased tremendously especially compared to
previous Atari products. If Atari was so insiginifigant, Nintendo's new
advertisements would not have even mentioned the Jaguar. Nintendo is
scared and they should be. Some terrific titles are on the way and the
Jag also has good third party support ... see AEO. I think Atari has a
fighting chance if they play their cards right. That would mean:

- Continue advertising aggressively.
- Get the games out
- Lower the Jag price
- Have Aliens Vs. Predator as the pack in game or else have a
pre-christmas offer of "Buy a Jaguar and get Aliens Vs. Predator free"
for would be Jaggies.

Pete ... for once cut Atari some slack and realize that they are
doing a much better job with the Jaguar than any previous products. Give
it a chance.

Please, no flames, as this is posted sincerely.

1. Are Atari computers still being made? I haven't heard about them for years!

2. If they are still being made, what is the current model(s) called?

3. What are the capabilities of the current Atari models regarding sound, animation, etc.?

4. Are these computers sold in the U.S.? How much for a new Atari?

5. Is software still being developed for the Atari? Are there good business, entertainment, and music programs available?

Not only can you do it now, you could have done it in 1.3 if you had a
clue. (Well, it needs one disk swap - taking out your boot disk and
inserting the blank one. :)

Oh, the hack to split the palette every scan line. But I want 17 colours
on this line! No can do? Hmm... :) (You see, I used to do a lot of
programming on these ugly beasts, so you can't pull the wool over my eyes
so easily.)

>out for the STe. As far as general use, what's wrong with the
>STe? Quick video display, easy-to-use interface, tons of software....

Quick video display? Sure, but it's still only in 16 colours in low res,
or 4 in med res, and you can't display the hires mode without a monitor.
You've also got no HW sprites...

>As far as disk swapping with a 6 disk program: the solution is
>to not buy 6 disk programs obviously :-). Seriously, if you
>need to use huge programs then you'd be best to buy a hard drive.

My point exactly. However, Requiem has been whining that his friend has
a 1200 and no HD and FCII is a pain to use... It's your fellow Atari
users that need this explained to them, I think.

>However, I would like to point out that a very nice word processor,
>ST Writer, worked fine with my 1 meg STe (with Thesaurus.) I
>used Fleet Street for DTP (nice output to a 9-pin printer.)

Well ProText works fine on a 512K single floppy Amiga... Your point?

>The games were plentiful. Spreadsheets like Kuma's worked fine.

When was the last mainstream game ported to the ST?

>There are good applications on the Atari that are small. I
>stick by the statement that a hard driveless Atari ST is
>far, far friendlier to use than a hard driveless Amiga.

And I stand by my statement that it isn't, at least it isn't if you want
to do anything more than simple wordprocessing or game playing. Advanced
applicatiopns require a HD. The ST's mainstay, MIDI, certainly requires
more than a stock machine... (Ok, it'll RUN on a stock machine, but for
any serious work you'll need at least a second floppy drive...)

>At the prices an STe are going for it is still a great system
>for a beginning user.

But they'll outgrow it very quickly, and they're a bitch to upgrade.
(Nice busy pointer, though. Does the Falcon still have the bee? I liked
that. :)

!Productions,
You call me clueless and don't tell me how to do what I was talking about. Thanks for being constructive :-). What are you talking about? Using a RAMdisk? If so, you'd still have to deal with the WB disk.
As far as ST games, many of them are great. I thought many of the ST games were just as good as their Amiga counterparts (the Amiga sound was much better, though.) I do not know what the last major game to be ported to the ST was. First, what constitutes a "major" game? Secondly, what does it matter how big the company that produced it is? Some people would claim that fun is all that matters in a game. I would. It would be a fairly long list of games if I was listing out all of the cool looking games that have come out recently for the ST (and Falcon-specific games.)
As far as video resolution, ST monochrome was great for serious applications. Display on an RGB monitor was also much crisper on the Atari than the 500.
My point was that there are many applications on the ST that run fine on a hard drive-less system. You haven't disproven my point. You gave me one application on the Amiga that ran on one disk. Still you'll have to deal with system disks, plain and simple. On the ST, go ahead and boot with no disk. Gain access to all desktop functions.

Well, at least they are very satisfied with TCP/IP. The
protocol performed excellent even under severe connectivity

I just wanted to comment on this:

Both IBM and Apple have consistenltly overlooked this important
low-end market -> the market who made it possible for me to afford
a computer (an ATARI 600xl and later on the ATARI 130XE) with which
I could learn to program in BASIC and later on in 6502 assembly.

I give thanks to both C= and ATARI that they did something in this
market, because I would have been deprived of useful tools otherwise.

I think this market is very very important...

The Jaguar's version of DOOM doens't run as smooth as a 486DX2 66Mhz
local bus machine (;-)), but it's running 15-20 fps in more colors
which is nice.

Richard, sorry to jump on you now like this, and although I know
you are replying to a Peter Post (TM) ;-) what the hell having
a hardisk in a computer has to do with having a serious use for it/
dedication?

I could say: the professional 3D software of the Amiga
shows the dedication/serious use of its users?

So? You need a monitor for the Falcon too.

You could use a wordprocessor on a bare-bones A1200 or a game.

>once, etc.

So let's assume it writes it out in single bits. That would be, well, three
million accesses to the low bandwidth RAM. How long would that take? About
a second? Maybe even two, if the Chiprams interface is really fucked up?
Wow, and you want to tell me that the program that took 40s to run would
be "significantly faster" if it saved those 2 seconds?!?

>> Now what else does it do that DJpeg doesn't do?

>It writes a bitmap into low bandwidth memory,

See above, maximum of two seconds....

>opens it's own screen,
>creates a message port that listens for the user clicking the right mouse

All of these are OS functions, and taken together, will take about, well,
0.1 seconds? OK, we are up to 2.1 seconds so far.

>does significant amounts of
>chunky to planar conversion, reduces the data from 24 bits per pixel to
>18 bits per pixel, oh, and it converts the data to HAM as well.

Which is exactly what is needed to go from what we want to display to the
display itself. 17.9 seconds minimum. I call that slow!

>Now consider what this involves, take
>previous colour, if the next colour is the same, or differs by one gun, then
>modify to that colour, if not, see if it, or a colour very close to it is in
>the base palette, if neither of these hold (rare case, but it does \

>compared to, say, the time taken to decode the jpeg and convert your data
>to a planar format (having an 8 bit chunky screen would help on these
>occasions, but AGA doesn't have one, so...) then you'll forgive me for
>not placing a lot of store by your coding ability.

Well, let's have a look. Compare the current 18 bit pixel with the previous
one for all three guns, and check the results: about 10 instructions. Checking
it against the 64 base colours, about 8 instructions each, so 512 instructions.
Of course, this could be speeded up a bit by using a hash table, so let's
say 200 instructions. Let's further ignore the "rare" case, this leaves us
with about 210 instructions/pixel, or about 80 million instructions for the
image. Now how many real instructions can an Amiga do per second?

All this, of course, assumes that we have a fixed set of 64 base colours,
which we don't change. BAD assumption, because the image won't look good.
So what we actually have to do is find a good set of base colours first, and
then do the conversion. But how can a good set of base colours be found?
Well, one standard method is vector quantization. Slow slow slow! You got
any better ideas? How do you decide which set is "good"? Least squared error?
Least absolute error? Do you think about objective criteria at all?

It is always easy to do something "kindof" right, but really unleashing the
power that lives within HAM is a process that takes a lot of time!

>> I mean, we are talking
>> about the time it takes from knowing what we want to display (the 24 bit
>> image) to displaying it...

>No, we're talking about the time it takes to go from a highly compressed data
>format (jpeg) to a displayable image. JpegAGA does not, as I have constantly
>pointed out, and as you seem to be incapable of understanding, keep a 24 bit
>representation of the jpeg in memory. That's everything from jpeg decoding, 24-18
>bit conversion, conversion to HAM, conversion into planar data (Ever writen code
>to do that? I have.) and writing the thing to the screen. BTW, I'm sure you,
>being so knoweledgable about all of this can instantly see why it's preferable to
>do the HAM conversion BEFORE doing the c2p, it seems perfectly obvious to me.

Ah, well, it is so obvious that I can't even see how anybody could think
of doing it the other way around... Sorry, I have written all sorts of
conversion routines from and to planar before (and in 6502 assembler, too :-).

And what makes HAM a "slow" mode is that it takes a lot of time to go from
a 24 bit representation of an image to a HAM representation of the same image.
And the fact that JpegAGA takes 40 seconds to complete where decoding a
JPEG to disk only takes 20 seconds to complete stands.

What is this nonsense about "JpegAGA does not keep a 24 bit image"? Decoding
JPEGs results in 24 bit RGB values. Whether these are keot in memory until
the whole image is decoded or whether they are converted to something else
while you go along doesn't matter, you start out with a 24 bit image.

>> Actually, it wasn't me :-)
>> But I'd still say that comparing the aspect ratio of character cells
>> (which are in turn made up from many many pixels) to the aspect ratio
>> of pixels is plain stupid.

>It's the same thing when the characters use blocks of 8*8 pixels, as used to be
>the case, though, isn't it?

I would be the same. But when was the last time you saw a PC using 8x8 pixel
characters? Saying "once, in the dark ages, the same aspect ratio was used
on PCs" is a bit different from "tens of millions of people use this aspect
ratio every day to get work done"...

>> Well, I for one prefer it when a horizontal line is exactly as thick as
>> a vertical line.....

>Fine, in 1280*512 draw your vertical lines 2 pixels wide.

Then why would I use 1280*512 in the first place, instead of 640*512?

>> Are you plain stupid, or do you do this on purpose? Can you read the words
>> "thin horizontal lines"? Can you imagine what kind of contrast a thin
>> horizontal line normally has to the surrounding lines?

>Oh, sorry, at the sort of resoloutions I'm used to using, 3-4 scanlines is
>still thin.

Excuse me? First of all, horizontal lines 3 scanlines wide will still flicker
(the edges, that is).
You must also have rather poor eyesight --- to me, a 3 pixel wide horizontal
line is rather thick even on 1024x768 on a 14" screen.

>> (I normally use rather thin
>> fonts, both the font used in my xterms and the one used in emacs have
>> one pixel wide lines).

>Likewise, can't say it's a problem.
>
Well, it is for me, and it is for a lot of other people. Hey, I would
love to use interlaced mode sometimes, as it would allow me to do 1024x768
on my monitor, but I can't stand the flicker it produces.

>> very disturbing (I won't say anything about the background patterns X likes
>> to use, other than without changing those, you really learn how bad
>> interlaced displays are!).

>You keep saying this, yet you are unable to give any evidence why interlaced
>displays are 'bad'. Are you seriously saying, that at a constant rate of
>sending pixels to the screen, an interlaced display will not look better
>than a non-interlaced one? If you are, then I'm afraid I really can't
>believe that you have given this any thought at all.

When sending pixels to the screen at the same rate, interlaced will look
better, sure. But using interlaced modes normally means effective screen
refresh rates below 50Hz, which just isn't good enough for me and a lot

of other people.
Try starting gwm in mwm emulation mode one day, and have a look at the
wonderful background pattern. And then do it on an interlaced screen.

>I ask you
>though, would you rather have a 1600*1200 non-interlaced display at n Hz,
>where the whole screen gives noticible flicker, or a 1600*1200 interlaced
>display at 2n Hz, where a tiny proportion of it may have noticible flicker?

I would certainly take the interlaced one. The problem is that for me to
take *any* of the two, n would have to be larger than 60. That means that
the interlaced screen would have a vertical sync of over 120 Hz. Not many
monitors do that....

OK, Mortal Kombat II, Sim City 2000, Jungle Strike, UFO Enemy Unknown, FIFA Soccer, TFX, Putty Squad, Cannon Fodder II, Sensible World of Soccer, Sensible Golf, Aladdin, Jungle Book, Guardian etc....

Most of these will be AGA only or have AGA versions available. Thankfully, they are mainly HD installable now too.

I don't know how easy to get hold of they will be in the US, or if you will have to run them in PAL mode though.

BTW, Did the Jaguar ever get either of the Mortal Kombats like jag advocates were touting a few months ago. The Amiga of course has had a good port of MKI and MKII is coming out for xmas. The only thorn in the side is that theres likely to be lots of floppy loading if they don't make it HD installable. Still, better a floppy based MKII than NO game at all, eh Atari fans? ;-)

Hi again,

I'm still having loads of trouble with both your E-mail addresses, which is becoming a right pain in the arse. Anyway I'd be glad to get involved with FOG and the Update disk. I think I'll write to you soon (there's some demos I want). At the moment I'm working on some 3d, could be an intro for the update disk, anyway it's true colour, and will involve lots of polygons running in one frame!!! (hopefully!) It will also have a nice true colour picture in the background. Anyway enough rambling.....

Alan.

The initial batch of 16-bit games (Dungeon Master, Starglider, Carrier Command etc) were certainly as good, if not better, on the ST (excepting sound) - reason: They were developed on the Atari and ported to Amiga.

Thankfully, these days such games are developed for the Amiga and can take advantage of it.

> I do not know what
> the last major game to be ported to the ST was. First, what
> constitutes a "major" game? Secondly, what does it matter
> how big the company that produced it is?

Probably Cannon Fodder was the last biggie.

Major usually means 'hyped' but also the sorts of games that _everyone_ wants. Major games: Doom, Mortal Kombat I&II, Sim City 2000, etc. The Amiga gets most of the majopr games, the PC gets more but IMO the Amiga does a better job of games than the PC, generally.

Uh, the desktop functions all relate to managing disks anyway.
So whatever way you look at it you're going to waste a lot of time with floppies.

Those are four 'big games'?!

Man, they are OLD NEWS!

Try Mortal Kombat I&II, Zool II and Ishar III (256 colours)

The proliferation of PCs and Macs means you have to spend rather a lot of
money to get a computer. Sure, you get a powerful machine for your money but
its still a lot of cash to pay. Its like the only cars you could buy were
Porsches.

The old days of home computers are going, and its the computer business thats
going to pay the price. Where are the next generations of programmers going to
come from?

Read Robert Rankins "Brentford Quartet", first for a good laugh and also
because they introduce similar ideas before Micheal Howard did.

The particular book is East of Ealing. Not very funny compared to the
other three but by far the scariest.

The Armmageddon series are good books as well.

Yes you could, just put your workbench on the RAD: disk and boot it from there
(ok, uou need to insert the WB disk in the first place to copy it to RAD:, but
it is no-longer needed for subsequent boots.)

True, but you are using RAM just to make essential desktop functions
more accessible. You don't run into this problem with the STe.

<regarding my list of "big games" on the ST>
Gavan,
They may have been old news, but I was responding to the claim
of !Productions who said that the store he worked at received
only 3 ST games in 1993. That is why they were old games.
How about Elite II, Ishar III, Robinson's Requim, Llamazap,
and a Falcon-version of Zool to name a few for this year?
Also, smaller companies are releasing games like Rock 'n'
Roll Clams, Stardust and Obsession Pinball? I also just
talked to someone from Dune, who are working on a Falcon
Wolf 3D clone.
Another point: I like Streetfighter 2 better than MK so I
really don't miss MK.

Incidently you can now get F030's with a 65mb HD and 4mb RAM for
#549 ukp. Now I know that is perhaps a little more expensive than an
Amiga but you get SO MUCH MORE. You also get a system which is so EASY to
use. I know. I owned an A600 until about 6 months ago.

With the Atari you get a simply drag and drop environment, this even
extends to the AUTO boot progs and the .ACC's (hmm I dont see these on
the Amiga). You also get all you configurations available from the
control pannel via CPX's. You don't have to go through millions of
different progs. Having said that the O/S (pre-emptive) still needs
looking at but atleast this can be modified from disk, is this also
true of the Amiga?

Having said that the Amigas graphics still manage to exceed that of the
F030.

Or you could simply have the copy command made resident as the computer was booting, this would negate the need to use alot of ram for a RAD workbench, and still allow the use of the format command on a one disk system without the need to swap floppies.

But if you want to get technical you have to swap floppies on either system as you need to take out the boot disk and put in the target disk on both systems. Unless the OS is in the ROM on an Atari (I plead ignorance here).

: BTW, Did the Jaguar ever get either of the Mortal Kombats like jag advocates
were touting a few months ago. The Amiga of course has had a good port of
MKI and MKII is coming out for xmas. The only thorn in the side is that
theres likely to be lots of floppy loading if they don't make it HD
installable. Still, better a floppy based MKII than NO game at all, eh
Atari fans? ;-)

The possiblity is still there. Williams is a Jaguar developer,
but they must wait until the end of 1994 (when another contract expires)
before they can port Mortal Combat I, II or III to any system. It's still
possible.

Watch the power supply on the 7800. The connections can fray
easily and the NON-STANDARD supply is hard to replace. Check
REC.GAMES.VIDEO.CLASSIC for people selling CARTRIDGES (not tapes). You
can get some wicked deals. Atari recently had a special where you could
buy any 10 games of your choice for $70. Not a bad deal.

Are the Pompey Pirates still around in the ST scene? I think they are
responsible more than anyone for the downfall of the ST's game market.
They used to compress 5 or 6 games onto a disk with a fancy menu, and
last time I saw one (about 3 years ago) it was disk #74. That's a hell
of a lot of games...

(At least people like Paranoimia have the decency to only give you one
game per disk. :)

Now I'm REALLY confused. The 1200 has no standard hard disk, you say.
The box has a bunch of spaces for putting a tick in to indicate the size
of HD fitted. According to you, this is proof that no 1200s were sold
with a HD. To me it means that some were and some weren't. Tell me, am I
missing something here? I mean, besides the fact that 75% of the 1200
owners I know bought theirs with a HD installed, and besides the fact that
some of CBMs 1200 "bonus packs" came with one, and besides the fact that
there are more HD-equipped 1200s than there are Falcons with or without
HD, and besides a whole lot of other indications that the 1200 DID have a
standard HD option, what more proof do you want?

The current American persiophobic nation is Iraq. Numerous governments from all over the world are believed to be or have been involved in this, including Iran, Iraq, Libya, and the hidden drug governments of South America. Hey, I don't have any evidence, all I know is what I read in the paper and watch on public television. The estimate floating around is approximately one-half the US currency outside the US is forged. Makes you wonder what's holding up the world economy. Must be all those Windows sales.

FWIW, Atari has stated oficially that they have not dropped computer production, and that profits from Jags will be spent on future computing machines. The bottom line is, if ATari tried to push only their computers or computers & Jag right now, they would fail for lack of resources. However, they can push just thje jag. I'd rather see them do something smart and have a chance of new stuff then see them valiantly charge off a cliff when they have no hope of surviving.

What a bunch of bull. Atari's computer line is dead.. There is no way Atari can come back into the market in a profitable way. The Jagflop has bombed, so don't expect any profits from it anytime soon. if the Tramiels had any brains, they would give up, close shop and live off the royalties from the patents..

What about the rumours that the Jaguar might be used as an arcade board
for MKIII? Also, why can't Akklaim (who did the Amiga, Sega and Nintendo versions
in the UK) do a Jaguar port?

If he mainly uses it for games, whats the problem? If he wants to do
something creative then he should check out AMOS, Deluxe paint etc. All
will work extremely well, even on the unexpanded 2meg A1200 (hey, i used
them extensively on a 1 meg A500). He just has to make a boot disk with
the apps on them. Tell him to buy a second floppy if he can afford it.
A low density model costs approx 40 UKP and a High Density will be 60UKP.
If he's going to be sticking with floppies for some time then a high density
drive would be a better bet. If he sticks with a single drive, then he
should check out powerpacker to get more on his system disks.

The Atari scene was strangled from birth by piracy. Many of the first
ST owners were ex-8bit owners (XL/XE) who had become used to piracy through
the high prices of games for those machines. Even from the first days of
the ST there was a big piracy scene. Once the Amiga became dominant, the
pirates pretty much killed of the ST software scene. You could say the
same is happening now with the Amiga vs PC.

The Atari port of SF2 must have been pretty amazing then. On the
Amiga the rather poor port of SF2 is left in the dust by Mortal Kombat.

Face it, for games the Falcon is a bit of a loss. Even the Acorn
Archimedes seems to get more games these days.

What I can't understand is the fact that you're conviniently forgetting
about the original (incorrect) point that there is no standard provision
for a harddisk in an A1200. I ask again, why have the HD size indicator
on the box if there is no standard provision for a harddisk (and even more
importantly, why was my 80MB box ticked?)

> Must be all those Windows sales.

It would be interesting to know how this estimate was arrived at.
Does anyone even have an idea of how much US currency (notes and coin)
is in circulation outside the US? How would one-half of that relate
to, say, the US monthly trade deficit? How is the US economy affected
by this unplanned expansion of the money supply (M0)?

We could go on to discuss the effect on the USD of the existence of
various kinds of "phantom" dollars: Eurodollars, Petrodollars, and
all sorts of commodity and business-to-business trading which is de-
nominated in USD but settled in something else (if at all). (Like my
purchase of an ATW-800 from a Swede for a price agreed in USD and
paid in a hodgepodge of european currencies ;>).

But then this *is* supposed to be comp.sys.atari.advocacy...

Rod: I won't blame you for thinking that an A600 is dull.

: >
: > With the Atari you get a simply drag and drop environment, this even
: > extends to the AUTO boot progs and the .ACC's (hmm I dont see these on

: Please explain, what is an ACC?

An .ACC is an accessory, which is a small program that lies resident in
memory and can be activated from the menu bar. This is much the same
mentality as the Commodities on the Amiga (yes, the Amiga has it, too!).
On the Ataris, you'll have to autostart all accessories before the desktop
starts up, or they will not appear on the menu. On the Amiga, you can
load Commodities anytime you like. Also, you can quit them if you don't
need them anymore.

```

$1999, that's about £1000 UK pounds? I consider that quite reasonable for an Amiga of that power, especially if the buyer was upgrading and had a lot of software he/she didn't want to sling out or have to pay to replace. Besides you'd have to be a bit sad to want to buy a Mac anyway in preference to a Amiga A4000.

Welcome to the Falcon owning clan Rod, a fine purchase. I would
recommend you get a copy of Digital Tracker (the new version) or even
MegaTracker, both can have up to _32_ channels of 50kHz DSP replayed
modules, they can handle S3M (ScreamTracker), MTM (MultiTracker) and all
known ProTracker/NoiseTracker/Soundtracker formats. Something I doubt
the Amiga could ever dream of. The sound of a 20 channel S3M is heaven
to my ears, especially considering it hardly even makes the Falcon sweat
to make music like this. I was impressed, I think anyone would be.
The price? Free of course, unless you are so amazed you decide to
purchase the commercial versions.

Standard 'provision'. I never said there wasn't - try reading my post
carefully in future seeing how syntax is so vitally important in this
group. Of course there is provision, anyone knows that. I was saying
that the A1200 didn't come with a HD as standard, not that there wasn't a
slot to put the damn thing in.

: Please explain, what is an ACC?

ACC is a desktop accessory. You can have loads of the little buggers all
available from your DESK menu on the Desktop and usually available from
within ANY Gem program that has facility to access them (not hard). They
range from disk copiers (such as Kobold) to Virus Killers (UVK) and even
silly little desktop hacks like 'mites' which eat away your work area.
ACCs are very versatile little things and having lots of them loaded
means you have a lot quicker access to those important programs you
require. Oh and most of them will Multitask perfectly.

: recent months from 500,000 to 200,000. Not a very promising start. People are

From 300,000 to 200,000 actually.
Atari has also had a large cash infusion (some $90 million) from Sega
which including game rights and ports, plus has signed up a deal with
Williams to produce more 64-bit versions of the hit Williams games. Also
Jeff Minter (soon to be flying to Sunny California) is working on
Defender 2000 - another sure fire hit for the Jag. I'd call that a very
promising start.

: still flocking to Nintendos and Segas current offerings and when those two
: firms come out with new consoles, the jagflop will be further pushed aside.

Project Reality (or Ultra 64) or whatever it is called. I don't see this
appearing for heck of a while yet. Sega has released their Genesis
add-on thingy, but they have an extremely limited production run on this
and the games available for it will be far and few - its just a money
spinner for them. Jag has the top slot this Christmas and I guess for
the most of 1995.

Why on earth does anyone bother reading and wasting their time actually posting and replying to the stuff that gets put in this group? I mean some people actually _pay_ for their online time and they spend it in here, seems very bizarre to me.

All that ever happens is we go around in circles (with the occasional Sinflop comment making us either cry in laughter or dispair). Nothing ever gets achieved here, its not a group for the 'better of Atari' or indeed Amiga. It's just a slagging ground where computer bods who think their machine is silicon heaven get a chance to try their best to prove others like them wrong. Doesn't this strike anyone as being a little strange? I don't know, maybe its theraputic somehow? Take all your agression out on a Sinflop post instead of your wife/kids/workmates? who knows! I guess at the least it keeps this kind of stuff out of the serious groups, it just seems ironic that you can sometimes get more traffic in such a nonsense group as this than you can in comp.sys.atari.tech!

What's worse is that I fall hook line and sinker for it all.
Time to re-evaluate my priorities I think.

It's a lot of messing about don't you think? On the Atari don't you just
select the drive and exec the format command? Seems a lot easier to me.

When an A600 friend of mine asked me to install a printer driver on
workbench, it was awful. They only had one drive and no RAMdisk, all I
kept getting was "Plase insert workbench disk...".

It seems a bit silly that you _must_ have a RAMdisk in order to use a
basic Amiga setup.

The Amigas extra meg is rather more useful - it has a 2 meg lowest
RAM config model whereas the Falcons lowest RAM config is 1 meg.

Many reatilers sell A1200s with HDs of varying sizes installed. Some
claim that their HD upgrade is 'Commodore Approved'. Basically, if you
mean standard as in 'every machine has one' then as I have pointed out,
only the Mac has HDs as standard.

Hello. I have an Atari 500 which i would like to be able to go online with. What is a fairly decent terminal program to use? I want to set this up for my daughters to use, so i don't want anything too cumbersome. (they are 11 and 13 and havnt had a LOT of computer experience).

I appreciate any info, also if there are any ideas on a particular modem..I'd prefer a used (2400b or over) but am flexible. Thanks

Burny

If I remember correctly, it's an "accessory", much the same as a
commodity, only less powerful. (Actually, it's closer to a program that
attatches itself to the "Tools" menu.) (The fact that it's called an .ACC
leads me to believe the Falcon is still crippled with the 8+3 filenames,
too.)

Gaven,

: What about the rumours that the Jaguar might be used as an arcade board
: for MKIII? Also, why can't Akklaim (who did the Amiga, Sega and Nintendo versions
: in the UK) do a Jaguar port?

It's no secret that Acclaim is rather anti-Atari and they aren't
a liscencee. However, their liscence to the MK games runs out at the end
of the year and then Williams is in control of all MK games. I haven't
heard about the Jag board being used in MKIII, but TWI has an agreement
to use Jaguar technology in the arcades.

<Regarding Gavan's comments about ACC and single-tasking>
Yep, the accessory was a way to get around single-tasking.
Even with multitasking, though, they have advantages such
not having to go to the desktop, find the program that you
want, open it, quit it after, etc. It is much easier to
just drop the menu, click on the accessory and close the
window when done, IMO.
Also, some people don't need multitasking. I normally do not
use it because I find that I do not need it. However, I
will say that multitasking is much nicer on the Amiga than
the ST (this might change with Magix!, however).

Right. The Falcon practically doesn't even have the software
developers.

It is now practically 100% sure that the Amiga will continue
to be manufactured... the question is when, by who, new price
and the new direction the new company will take.

I'll expect re-manufacturing by Feb 1995, but that's just
my speculation.

|> > what was your argument, Raist?

My argument? You are mentioning POV-RAY? DOn't make me laugh
please. Pov-ray not only is on the Amiga too anyway, but that's
not what I would consider a top-notch raytracing applicaiont.

And what does raystart do? Just 3d pictures? At least
reflections?

Just because you got a raytracer doesn't mean is a good one...

Let's see:

(and let's pick on raystart, since it is the commercial one):

* Keyframing support?

* paths for objects? (for animation)

* Any animation at all? (maybe raystart is for still pretty
pictures)

* glass? Refraction?

* 3D morphing?

OK, so much for the *BASIC* FEATURES, now let's go to the
real-kick butt features:

* simulation of forces (radial, gravity wind?)
* collision detection (throw a ball through a brickwall and
it explodes AUTOMATICALLY)
* Fog, atmospheric effects?
* Procedural mathemathical mapping?
* Inverse kinematics?
* Keyframe motion graphs? (envelopes in Lightwave)
* Gases?
* Point, Line and Spotlights with % of fading at the edges?
* Boolean operations using constructive solid geometry.. AND
ANIMATED boolean operations?
* AREXX support (for programming the 3D application)

* formula/path animation for animating real-world science objects
like an electron in an orbital in the Helium atom
* 3D spline meshes?
* Skeletons
* Bumpmapping, Reflection Mapping, Trasnparency mapping?

The above features except for automatic gases and keyframe
motion graphis are for REAL 3D *ALONE*. There are even more
I won't list, and LIghtWave, Imagine and Aladding 4D are as competent
in other interesting areas.

So how raystart measures up or is it "only second rate"?

BTW, LightWave is bein used heavily in the U.S> for producing
TV series and even for some graphics in some movies.

How about the processing programs? A list of features would
be nice, but let's say:

Do they have a macro language like those on the Amiga?
All of them in the Amiga (ImageFX, ADPro and ImageMaster) support
the Amiga AREXX.

And ArtDeparment professional has been used extensively in the
video market in the US. Image F/X also has quite a user base
and Time Warner uses it for color correction of some cartoons they
are doing.

So that's my argument. Please by all means illustrate me, if
the software you listed is better. We can compare features.
Who knows, maybe the software you listed is better (he he , doubt it).

BTW, the software I listed above is commercial, not PD or shareware.
There's also quite a bit of shareware software in those areas
for the Amiga too... let me know if you are interested ;-)

|>
|> Lightwave, Imagine, Real 3d ....

Well, Gavan, I hope you are not bothered that I expanded on your
list ;-)

Gavan,

: Thats what jaguar advocates said LAST Christmas. It didn't happen
: then and it won't happen now.

Some Jaguar advocates tend to misinterpret facts. Atari
themselves said that only a few Jaguars would be released in test markets
and that's what happened. A full scale launch didn't happen, and Atari
NEVER did anything to suggest otherwise. BTW: Since the announcement of
Aliens VS. Predator, Jaguar sales in my area have picked up.

Bzzt, wrong! It's 0.8 meg more than me personally. However, all those with
HD drives (All A4000's and many newer A1200's) can format a standard HD disk
to 1.96 megabytes (sectored).

Commodities are memory resident, appear at the press of a hotkey, and can be added or removed at any time. The calculator, for example. Say I'm using a WP, and I need to perform a quick sum. On the ST, I select the Calc .APP from the menu. All well and good, but I have to close it before I can enter the results into the WP, and then open it again if I need to do any more. On my Amiga, I hit L-Alt + C, and one pops up on the current screen, and I can leave it there until I'm done, and then hit L-Alt + C or click on the close gadget to get rid of it.

>Also, some people don't need multitasking. I normally do not

You may not think you need multitasking, but once you've used it for any length of time you'll wonder how you ever managed without it.

<regarding discussions of video/raytracing software>
Raist,
Your original argument was that you could say that the availibility of professional video software for the Amiga proved the seriousness of the user base. By this I had thought that you were implying that there were hardly any raytracing/ imaging packages for the Atari. I did not know you were going to get into the argument about which has the _better_ software in this arena.
First, let me say that since I don't need these packages I don't know of their features. However, let me point out that I menitoned a $60 package. The packages you listed were much more expensive (judging from Amiga World). So, yes, Raystart probably _is_ second rate compared to your programs.
I still believe that I refuted your argument- you cannot say that there is a more serious Amiga user base because you have professional image software because the Atari market has professional image software itself. What do you think that the Medusa is for?
I'll have to leave a feature comparison to someone more knowledgable (sorry). You should have argued for the Toaster- I'd have to have given you that one ;-).

Actually POV-RAY is potentially very powerful but let down by
its lack of GUI.

As you say, its on the Amiga too, but the 'best' place to
do POV work is on the PC which has had a couple of excellent
GUI front-end modellers made for it. Since the souce for
POV is freely distributable and has made it on to many machines,
what you can do is run your modeller on the PC and actually
generate your scenes on a sun or HP workstation (or even a
network of them)!

If I get some free time at work, I'd like to experiment with
this idea a bit. We have a large network of sun and HP gear here
that sits and does nothing at nights. The total computing power
is quite considerable...

Has anyone done this or does anyone have any tips on POV?
There must be a usenet news group somewhere.....

Has anyone seen 'Donkey Kong Country' on the SuperNES? It was
on tv here in the UK last night and it looked _awesome_!

If they can keep cranking out games of that quality, then theres
probably life in the 16 bit consoles yet. Certainly enough life to
get them through to whenever their 'next generation' console appears.

Atari have been given an amazing 'second chance' with the money
from Sega. Lets hope they don't blow it this time.

With their past record, I wouldn't bet on it though......

I prefer the Amigas commodities myself. Theyre available in
all apps. With an ACC if you're multitasking, is the ACC installed
in a specific 'session' or is it available from ALL current
sessions?

> Also, some people don't need multitasking. I normally do not
> use it because I find that I do not need it. However, I
> will say that multitasking is much nicer on the Amiga than
> the ST (this might change with Magix!, however).

I'd say multitasking is THE feature of all modern OSs. Every
OS these days either does it, or tries to do it. Its been accepted
as a 'must have' feature.

The Amiga advantage is that it has had multitasking since day one
and as such programmers have always been able to take advantage of it.
On the ST, Mac and PC the OS' all started out as single tasking and
have been 'hacked' to do multitasking subsequently. You only have
to look at windows and sys 7 to see how badly the job has been done.

>slot to put the damn thing in.

The A1200 does not come with a hard drive as standard. However the A1200HD
does. You get a choice of factory installed drives.

What also happens often is if you don`t want one of the sizes shipped by
CBM, the dealer will take a normal A1200 and put a drive in for you.

This accounts for the difference between `CBM approved` status and not. ie.
a CBM factory fitted HD is under CBM`s home service agreement whereas one
fitted by the dealer is not.

Is that simple enough to understand?

ps. You used to get Amiga 2000`s and Amiga 2000HD`s too. Same idea.

>ACCs are very versatile little things and having lots of them loaded
>means you have a lot quicker access to those important programs you
>require. Oh and most of them will Multitask perfectly.

Thought as much. Under Workbench, these are called `Commodities` and are
used by any program - your program doesn`t have to have a facility to
access them. They are available anywhere, on any public screen.

You can assign hot keys to any commodity and they can be killed/paused etc
from the `Exchange` commodity. And ALL of them multitask perfectly.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Currently I have the following commodity programs running

Clock,
screen saver
mouse blanker (blanks the mouse when you type)
virus killer
tools menu customization (adds programs to my tools menu)
print spooler (and manager)
pop up menu (ie. at the mouse rather than at the menu bar)
3d menus
Animated requestors (nice anims and any sound for warning etc requestors)

I have quite a few other commodites too but don`t run them all. For
instance, I just leave the calculator out on the desktop so it`s available
anytime from there rather than in an app. If I used a spreadsheet or
maths package often enough I imagine I`d make it a commodity.

Gavan,
When in MultiTOS, a double-click on an accessory will cause
the accessory to be placed in the desk drop-down menu. It is
then available in any GEM program by accessing the menu.
If I wanted something like a calculator commodity under
MultiTOS, I could always set up my calculator as a PRG and
assign it to a keypress to activate it. Otherwise, I could
just access it via the desk menu as an accessory.

: from the `Exchange` commodity. And ALL of them multitask perfectly.
: ^^

While we're on the subject of useful features of AmigaDOS, I've not seen anyone mention datatypes.

Datatypes are a brilliant idea, but under-utilised at present.

For those people who don't know, a datatype is a _universal_ piece of code to handle a file type. For example I've got datatypes to handle GIF,JPEG,PCX and IFF filetypes (sound,text,anim,etc datatypes are also available) this allows any program which can handle datatypes to access any of the filetypes with a corresponding datatype. The program need not contain code to handle specific filetypes.

The potential of this system should be obvious; imagine that you have a number of programs that use graphics files (paint program, image processing, DTP, word processor, WWW reader, etc) and suppose a new format emerges, for arguments sake call it JPEG2. With datatypes you simply obtain a JPEG2 datatype and all of your programs can _immediately_ handle the new format !!

As I said this is a seriously under-utilised feature at present. But anyone who's waded through huge menus of file formats for an import should see the potential of this idea.

It is also another method of preventing the bloated programs that are so prevalent in the PC world.

YOu got a major problem with that argument Peter: in the 3d animation
market you can't call the Amiga software crap, and if you do the math
properly a PowerMac would cost more (or a 68040 Mac) WITH THE software
than the Amiga.

In other areas, you might be right, but desktop video is a very nice
important area for me, and the reason why I bought the equipment I have.
Now, would you dare to argue this point?

>Now, would you dare to argue this point?

Okay, I will oblidge. Lets take the issue of hardware.

PowerMac 6100(soon 6166) 8/250 = $1700 with keyboard.
Studio Pro 1.5 = $900 from macWareHouse
Infiniti- D 2.6 = $519 from MacWarehouse
>
side note, you may only need one of the above animation apps for use. As you can see the total cost with both apps is still price lowered than the $3000 Warped A4000.

: my speculation.

Please post some evidence of this (from a DECENT source). Last I heard a company who had already booked a champagne party to celebrate taking over Commodore had to cancel at the last minute because it all fell through.

You are right, it is just speculation, you realise how important the Christmas market is? Even if Commodore (or whoever) started manufacturing them Amiga's YESTERDAY, they would STILL miss the Christmas market, just take a look in any high street shop - there is no place in their stands for the Amiga and they wouldn't make one, they have to plan their Christmas stock well in advance. Commordore (RIH) (rest in hell :) has missed the boat, so do they go for a Summer launch next year? I doubt it, more like Christmas NEXT YEAR if at all.

: of a lot of games...

: (At least people like Paranoimia have the decency to only give you one
: game per disk. :)

Oh please. Pompey are no longer around, they did very high quality
cracks indeed often including trainer functions, skip intro options and
more. Automation got up to about disk 580 before they quit (or changed
name). but this is nothing, the Amiga piracy scene is HUGE I mean
absolutely HUGE. There is nothing on the Amiga you can't get a cracked
copy of, how do you get this stuff? Easy, just reply to any advert in
the classifieds section which ends with a comment like '100% reply
guaranteed' or 'swaps wanted'. What is worse is that the Amiga piracy
scene is STILL going on, strong as ever, while the ST one is nearly dead
which is good for games being released today.

Don't try making it sound like Atari had all the pirates, thats complete
crap, the Amiga has some of the best crackers in the business and still
has, although the PC world is fast catching up.

Of course those games are crap - they aren't available for the Falcon
(or ST) so it stands to reason that they must be useless......

If you want 'serious games', then you must be really pissed off that you
can't play SimCity 2000, UFO Enemy Unknown, The Settlers, Detroit,
Simon the Sorcerer I&II, Beneath a Steel Sky, Dungeon Master 2 - Skullkeep
Armour Geddon 2, TFX etc.

Whoops! I forgot, they're crap as they aren't on the Atari.

I thought I'd just state my point of view as this argument has been bouncing backwards and forwards for weeks now. I think that AmigaDOS was pretty dire on all Amiga systems except A1200 with HD. Put on this machine it really does seem quite nice IMO. Although I'm a Falcon owner I think I would like it if our OS was as mature and powerfull as the Amiga one. Having said that I still say that a bog standard Falcon is in many ways TECHNICALLY far superior to an A1200 even with FastRAM. I beleive this coz of the Falcon demos I've seen compared to the AGA demos I've seen.

Although GEM isn't the most amazing GUI in the world it still let's me do what I want and can be enchanced with NVDI and WINX.

Let's just try to be happy with what we've got, OK?

> scene is STILL going on, strong as ever, while the ST one is nearly dead
> which is good for games being released today.

Oh, I see. Piracy WAS good when it was on the ST and there were lots
of games but now theres no games on the ST but plenty of games and piracy
on the Amiga its bad.

The reason the ST piracy scene is so 'poor' is that there aren't
exactly a lot of games on the ST to pirate for. The pirates follow the
machines with the most games. They aren't going to hang around a long
dead platform with less new games than the archimedes.

> Don't try making it sound like Atari had all the pirates, thats complete
> crap, the Amiga has some of the best crackers in the business and still
> has, although the PC world is fast catching up.

I didn't say that. I said that the games market on the ST was killed
off long ago by the pirates.

AS for the Amiga having the 'best' crackers, I will admit that its good
to see non-AGA games such as SWIV and R-Type2 being made AGA compatible
by pirates, and also games that don't HD install going to HD, but their
impact on the software market it 90% negative, 10% positive.

And I'm saying I'd rather have a meg of extra RAM space and less floppy
space for a hundred quid less than the nearest priced Falcon model.

Whereas the shops are really _flooded_ with Falcons, eh? I haven't even
seen any Jaguars about and they are supposed to be recieving the full
'benefits' of Atari's promotional push.

What I do see is LOTS of new games software for Christmas on the
shelves. How long has it been now since we saw any appreciable Atari
software high street presence?

2, 3 years?

>because it has not been formally released"...

No Peter, remember what we've been saying all along? No, probably not. You've
only got 32 bits of RAM, just like DKC. to refresh you: (no RAM pun intended,
for those who know) The Jaguar was released to two "test markets" last
year. The Bay Area (San Francisco to the uninitiated and geographically
imprecise) and New York. Since then, it has trickled out (no big "it's now
everywhere" party, just distribution) to the rest of the country & world.
By now, it is available everywhere, so when the advertising is seen, people can
actually go out and get one.

>> Sorry Sinflop, but Sega barely sold a half million Genesis

>close as bad as Atari's. Sega's parent company had deep pockets..

Before the Sega MS, what market share did sega have, 0? Actually, I do
remember a sega 8-bit thing, but it seemed to have as much impact as your
typical Atari console (Jag and 2600 not included) So, they did have
a similar market position. Since you brought up money instead of talking about
the subject, I assume you didn't know what Market Position was.

Excuse me, is this getting ridiculous? Booting from a RAM disk? I beg your
pardon! Why would anybody do that? I mean, I boot my PC maybe once a week,
and that is after I switch it of to change hardware. Why would you reboot
a machine when there's no need to power it down?

I wasn't trying to imply the ST had ALL the pirates, I was just saying
that it had its fair share. However, all this talk of Amiga pirates
leads me to mention that I own exactly 0 pirated games. I only know one
person who has any at all, and he's only got one. (It's Ports Of Call,
for anyone who's interested. We tried to find a real copy to buy, but no
luck. :(If we COULD find one to buy, we would. It's a great game, and
it blew my socks off back in 87.)

Hi--

I was just wondering if any development were going on with the Falcon (i.e., 040 or RISC Falcon, or 060 Falcon)--if the Amiga doesn't have a new owner by the time I graduate, it's time for a new line. Also, can it emulate Mac II/IBM 386? Thanks.

Chris, I am not the one who enjoys bursting bubbles and hopes, such as
the one as the Jaguar -since it's an interesting technology- but ATARI
has sold so far only 90,000. The main problems with it have been game
availability and looks like *FINALLY* the problem will be solved.

I would love the Jaguar to succeed but so far it is still on shaky ground.
I hope ATARI uses the $90 million bucks from SEGA well this christmas.

: they would give up, close shop and live off the royalties from the patents..

Read this and weep Sinflop:

[included JAGUAR.OCEAN from AEO]

Dragon was released to production two weeks ago. Demolition Man and Creature
Shock are both progessing quickly, and Virgin have other Jaguar projects well
underway.

Ocean have just submitted Syndicate for Atari compatibility testing and Theme
Park is due before the end of the week. Both are definitely Christmas titles.
Ocean also are actively working on further titles for Jaguar.

Calls made to the two companies customer service lines revealed little/no/
incorrect knowledge of Jaguar game status. This is not to belittle nor to
denegrate either of these two companies - typically, software publishers'
customer service lines are directed to existing product, and are not set
up to deal with items otherwise.

Are you trying to tell me that Ocean would support a 'dead' console?
Check your facts Sinflop, you are speaking pure bull again.

Then you live in a superbly sheltered place. The Jaguar can be found
almost anywhere now, 4 shops in this town carry it alone. Heck even the
Falcon can be found in the right places (ie Silica departments) for the
public to see. Wake up to the reality, there is NO place for Commodore
this Christmas, forget the software, that isn't going to make Commodore
any money is it? They need to sell machines, but they are not going to
because there are not many left, as soon as stock dries up you are all
buggered, face it.

I have a new Atari Portfolio PDA that I have only used for two weeks. I am looking to sell the PORT, AC Adaptor, 32K RAM card, File Manager software, PC transfer software and Parallel interface for the PC. All this for $99 including shipping !

If you are interested, please e-mail me direct: TLC76@ aol.com

: Sega's install base is over 15 million. Their market position was not even
: close as bad as Atari's. Sega's parent company had deep pockets..

Sorry Pete, but that's current Market situation. You're
forgetting that Sega came from a market position plagued by Nintendo's
monopoly techniques. The Genesis did not take off until late 1990 and
many developers were initially worried. Remember ... the SEGA MASTER
SYSTEM? I owned one. A great machine, but it sure wasn't a success in
North America. And yet Sega was able to overtake Nintendo, when they
started out with an 8% market share. Given Atari's recent cash infusions
and the arrival of games in the pipeline, Atari does have a good chance.

ha ha. Obviously they must be kiddies games - thats why the Falcon
doesn't have 'em. I suppose the lack of games 'proves' what a great
'serious' users machine the Falcon is...

You've been reading too much sinFLOP.

> and they most certainly are not. If I want decent strategy games I'll
> get them for my PC, but games don't play a major area in my computing
> life so I don't need them.

I thought you said earlier you liked serious games? Now I've
pointed out that there aren't a lot of 'serious' games available
for the Falcon either suddenly you think all games are worthless.

Still, as you point out, you've got a PC. Now, if you don't like
games and prefer to use your machine for serious use, then why do
you bother keeping a PC as well as a Falcon? Doesn't the Falcon
fulfil your 'serious' needs? It certainly won't fulfil a gaming
role.

Sorry, I was thinking of Dixons, Rumbelowes, Virgin Megastores and
'Game' stores. Maybe availability varies geographically. Lets face
it, Silica aren't exactly a nationwide presence, though they are
a good mailorder company.

You seem to be getting very excited about a games machine. You
just said in another post that games weren't important to you.
I guess when it comes down to it, Atari NEED to be sucessful as
a gaming company since they've pretty much failed to sell computers
sucessfully.

Who knows, IF the Jaguar does well then in a year or twos time
you MIGHT see some more developement on an Atari home computer
line. In the meantime, Amigas are in a hell of a better position
than any of the Atari home computers, regardless of the manufacturing
position.

4451. Latest From The Trade

Newsgroup: comp.sys.atari.advocacy
Date: 1994-10-29 11:45:26 UTC
From: mgoodman@goody.demon.co.uk
Message-ID: <783431126snz@goody.demon.co.uk>
Source record: 14958

A few snippits from the trade press - 31st Oct 1994

From CTW - (Computer Trade Weekly)

Alien devours Knuckles.....
Early sales of AVP seem to have lived up to Atari's expectations -
particularly in Maidstone Kent. Diane Hobson of Game Zone told
CTW, (Computer Trade Weekly), that the store has already sold
out of its first stock of the game, AND that it's sold more copies
than Sega's much hyped Sonic & Knuckles.

Jag Headset due for Xmas 95....
Atari have joined forces with arcade games firm Virtuality Group in
a bid to produce a $200 home VR system...
"The Atari Jaguar platform is the only 64-bit system currently on
the market and is ideally suited for immersive virtual reality
games" said Jon Waldern, Virtuality's CEO. "The deal propels both
companies to the forefront in the home market for virtual reality
gaming. Thanks to the Atari Jaguar, fans of our many arcade titles
will be able to play their favourite virtual reality games at home"

Plus from Computer Retail news....

Atari's AVP rocketed straight into the listings.....meaning the
entire Jaguar installed base was not put off the game after a
rubbishing in the Edge magazine.

Incidentally the headline on the front page of Computer Retail News
may be of interest to some.....

CHELSEA IN COMMODORE WIND UP BID
Quote..
Alan Shaw, club secretary at Chelsea said: "The debt is not in question.
The money was due at the end of last season and we have not yet been
paid. I believe the bonus was insured and that Commodore has been paid,
but it has not been passed onto us".

Commodore UK stated they were taking legal advice.

: If I remember correctly, it's an "accessory", much the same as a
: commodity, only less powerful. (Actually, it's closer to a program that
: attatches itself to the "Tools" menu.) (The fact that it's called an .ACC
: leads me to believe the Falcon is still crippled with the 8+3 filenames,
: too.)

Actually, accessaries are quite useful as a way of obtaining an essential minimum level of tool availability without the processor/space overhead of running a full multitasking system. Something which many people do not want to run on the Atari.

Actually, this applies on virtually every platform - most users of System 7 and Windows etc. will only ever have one app open at one time. And it's getting annoying watching people hog the very limited supply of undergraduate workstations here just to check their mail in an Xterm window.

The 8+3 problem is rectified with MiNT, which allows filenames of any length to be used with loadable file systems. IIRC MinixFS allows filenames of up to 254 characters, depending on how you initialise the disk.

: to look at windows and sys 7 to see how badly the job has been done.

Actually, I would say that although the Atari has only had viable multitasking for a relatively short time, it's actually in quite a good position. As a programmer, it's fairly obvious to me that GEM was designed from day 1 to be upgraded to multitasking capability. Simple IPC has always been present, for example, via appl_read and appl_write.

BTW, any of the current multitasking systems on the Atari multitask in a more sophisticated way than System 7. Mag!x has relatively basic but workable preemptive multitasking, and its capabilities in the Falcon version are rumoured to be on a par with MiNT.

moran@bires059 (G MORAN) writes:
!
! I prefer the Amigas commodities myself. Theyre available in
! all apps. With an ACC if you're multitasking, is the ACC installed
! in a specific 'session' or is it available from ALL current
! sessions?

I don't understand 'sessions'. Where you used to have the Desk menu
you now have an extension such that ....

```
Desk Desk
|-----------------| |-------------------|
| About program | | About current prog|
| DA 1 | | DA 1 |
| ... | | ... |
| DA 6 | | ... (No limit) |
------------------ +-------------------+
| Application 1 |
| ... |
+-------------------+
```

But there's no sessions as such, you can have multiple apps/accs on
screen all accepting input/outputting data at the same time. You
can either 'Top' a window to make it the foreground session or
click on it's entry in the Desk menu.

Simon.

Me too, but then it doesn't matter to me anymore, I've been wanting an external floppy for some time (Do a lot of file transfers from aminet->pc->amiga, and only being able to format one PC disk at a time, and copy from one disk onto my Amiga at a time was getting annoying), so yesterday, I picked up an HD floppy drive from the Future Entertainment Show. Now I have the best of both worlds :-)

: In article <38ip24$6no@bs33n.staffs.ac.uk>, cm3hirjd@bs47c.staffs.ac.uk (Requiem) says:

: Thought as much. Under Workbench, these are called `Commodities` and are
: used by any program - your program doesn`t have to have a facility to
: access them. They are available anywhere, on any public screen.

The 'facility to access them' is actually present in virtually every
program available - it is actually just a GEM menu bar.

: Clock,
Same here
: screen saver
Same here
: mouse blanker (blanks the mouse when you type)
No need - all the apps I have blank the mouse automatically if it's over
text.
: virus killer
I don't bother - I've never had a virus in the 7 years I've been using
Atari computers
: print spooler (and manager)
Yes.
: pop up menu (ie. at the mouse rather than at the menu bar)
Popup menus are a separate feature in GEM - programmers decide when to
use them rather than users
: 3d menus
N/A
: Animated requestors (nice anims and any sound for warning etc requestors)

Accessaries actually seem to work in a very similar way, apart from the
shortcuts.

Also, it's a relatively easy job if you have an application without a
menu to turn it into an application - maybe 20 extra lines of code. I
don't know whether this holds for Commodities or not.

Subject: Contact Names Please..
Newsgroups: comp.sys.amiga.advocacy
Summary:
Keywords:

I'm needing help from you computer fans...

I'm helping to organise a Festival of Toys at Satrosphere (a hands-on science centre - you know the type "learn about science the fun way") here in Aberdeen, Scotland. Since computers/consoles are toys (of sorts) it seems reasonable to expect a display whats available and new in the computing world.

However since we are "a charitable educational centre" - that's how we are sometimes described - we can't afford to buy equipment for a short festival which will run for a couple of months and so are looking for computer firms that might be interested in showing their wares. If you realise that most Computer shows are held in London/Birmingham, we Scots don't get a chance to play... ahem see the latest in computer technology and so a company could receive more than favourable attention from the public and press in the North.

So if you have contact names and addresses for the following companies I would be very grateful if you'd give me them

Amiga International (Commodore UK)
SEGA UK
Nintendo UK
Atari

If you know of any other company that may be interested sent it too. Also Contact names are really important since it goes directly to somone and not just to a building.

Thanks

Andrew R Harrold

Atari are dead. The Jaguar is not a flop. Neither is the Falcon.
For companies of the manitude of Atari and the image of Atari, they
can't just produce a wonder machine and be overnight success. It takes
time. The Jaguar to mind, is amazing and having a more than reasonable
chance of making Atari a good return on there investment. At least now,
here in England you can buy a new Atari good in an electrical shop;

Atari can and will make a success of the Jaguar.

Gavan,
3.5 megs? Hah! I can just get a floptical drive for my Falcon :-). Seriously, you have to buy a high density drive. The Falcon comes with one standard. It seems a lot of the Falcon vs. 1200 argument has been that anything the Falcon has the 1200 user can add-on. With the larger price difference in the past this may have been so but the price on the Falcon in the UK has been dropping and over here the 1200 has been getting more expensive. So, first you add the HD drive and then the MIDI ports....

G MORAN (moran@bires059) wrote:
: You seem to be getting very excited about a games machine. You
: just said in another post that games weren't important to you.

You are quite correct, games don't bother me much. But this is Atari we are talking about and the survival of Atari bothers me greatly. Hence the success of the Jag does. Logic really.

: I guess when it comes down to it, Atari NEED to be sucessful as
: a gaming company since they've pretty much failed to sell computers
: sucessfully.

Sure.. like they failed SO badly with the ST didn't they? Wake up! They have a bad track record, no denying that, but I agree they do need to be successful with the Jag for the above said reasons.

: Who knows, IF the Jaguar does well then in a year or twos time
: you MIGHT see some more developement on an Atari home computer
: line. In the meantime, Amigas are in a hell of a better position
: than any of the Atari home computers, regardless of the manufacturing
: position.

So what happens if some, like, REALLY stunning software comes out for the Amiga, say 10-20 gob-smacking games that make SNES owners wet their pants with anticipation and they ALL rush out and want to buy an Amiga? Where do they rush to? There is nothing left, stocks will do nothing but go down. Sorry, but I thought the manufacturing abilities of the parent company were rather important myself. I know you will say 'well Atari arn't making computers', but the fact remains they still have the capabilities to. While Commodore (heck even CBM UK) have to do battle with angry football teams wanting unpaid funds :-)

: for the Falcon either suddenly you think all games are worthless.

Depends what you constitute as a 'serious' game doesn't it? Heck I wish I had time to play games, but I don't, so like I (keep) saying games are kinda low on my list of computing priorities.

: Still, as you point out, you've got a PC. Now, if you don't like
: games and prefer to use your machine for serious use, then why do
: you bother keeping a PC as well as a Falcon? Doesn't the Falcon
: fulfil your 'serious' needs? It certainly won't fulfil a gaming
: role.

Actually the PC is for Uni work, until they convert Visual Basic for Windows to the Falcon (hmmm not too likely that) I'll be stuck on the PC environment, not one I'd prefer to be on, but I don't have too much choice. That's why I keep a PC. Oh and it comes in handy for reviewing Falcon software... have the soft running onthe Falcon and then review away on the PC laptop. Oh and before you laugh even further, the PC is a Commodore one. Damn fine it is too. Cept no-one will upgrade it for me (companies never heard of it!).

Now that's a really dumb comment Peter. You aren't reading game magazines
at all are you? The Jaguar hasn't been successful but it surely has the potential,
as any Marketing 101 course would tell you.

Peter, ATARI is actually even advertising and quite good. The Jaguar's future
is not secure, but it is surely there with a chance. 3DO right now has more
trouble.

Rightly so! Actually, this is one of the most obvious moves
to an object oriented OS. AmigaOS 2.04 introduced several object
oriented concepts (Intuition classes) and 3.00 expanded on it.

Still NextSTEP rules in this area though ;-)

Not really...

|> priced 3DO is actually outselling the Genesis and SNES in many areas.

Where? 3DO is facing now a big problem because they have lost about
$200 million bucks (source: Wall Street Journal). Actually not 3DO directly,
but the guys who are manufacturing them particularly Matsuhita.

And they are about to put a $3.00 fee increase on software developers
to help cover this loss (they call it "market developing fund"), which has
all of their developers p*ssed off right now, and some are considering
abandoning the platform altogether. This is, IMHO, the Jaguar's best time
to outsell the 3DO.

|> Gamers are making the transition, knowing that Nintendo and Sega are

You should see Donkey Kong Country, and see why some people are not
bothering with 'this transition'. SUre, there are some ready to make
a transition but they are waiting.

The 32X will outsell the 3DO easily this christmas.

Yes, I saw it. Nintendo is sending videotapes on the 'making of'
to those that are subscribed to Nintendo Power.

And _awesome_ is an understantement.... THE GAME KICKS SERIOUS BUTT,
and it's graphics are in the Jaguar/3DO/Sony Playstation class!!!!

YES, I KNOW WHAT I AM SAYING BY SAYING THAT, BUT IT'S TRUE!

And 'only 16-bit'... well, so much for the 'bits of power myth'.

Actually, I thought the S-NES could do it (well, I wasn't *THAT* sure ;-)),
but my question is how the hell they compressed those graphics... Those
graphics are hard to compress...

|>
|> If they can keep cranking out games of that quality, then theres

They (Power) were selling them at the show for 60 UKP, so I'm quite happy.
It's certainly VERY nice to get 1.92 megabytes free space on a disk. :-)

Source record: 14974

: |>
: |> I doubt it. 16-bit Sales are really on the decline. The higher

: Not really...

No? Is this why Sega and Nintendo are reporting declining sales? Or why
the prices of the Genesis and SNES have been reduced? Or why many stores
are trying to clear out 16-bit games at VERY low prices? They are not
what they used to be, which = DECLINE!

: |> priced 3DO is actually outselling the Genesis and SNES in many areas.

: Where? 3DO is facing now a big problem because they have lost about
: $200 million bucks (source: Wall Street Journal). Actually not 3DO directly,
: but the guys who are manufacturing them particularly Matsuhita.

Well ... let's see. The 3DO lowered it's price from $700 to $399,
so that's a lot of lost revenue right there. Panasonic is the main
manufacturer around here. And ... many stores (Babbages, Electronic
Boutiques) have reported that they are currently selling a higher volume
of 3DO's than SNES or Genesis machines. Check the net.

: And they are about to put a $3.00 fee increase on software developers
: to help cover this loss (they call it "market developing fund"), which has
: all of their developers p*ssed off right now, and some are considering
: abandoning the platform altogether. This is, IMHO, the Jaguar's best time
: to outsell the 3DO.

I think the Jaguar will be able to pick up as well. I'm not a 3DO
advocate ... I'm just stating the facts. Remember ... in the
Nintendo/Sega Duopoly, the Jag and the 3DO should be considered allies.

: The 32X will outsell the 3DO easily this christmas.

Possibly. The 32X will only have 6 games for it, though. The 3DO
now has a big software library with big games. True, twenty million
Genesis owners will likely find the 32X appealing, but forking out $160
bucks to play 6 32X games insn't going to convince the masses. Even the
Jaguar has more games.

BTW: Would you mind stating your name when you make such posts?
It's hard to respond to a nameless entity.

The ENITRE CONSOLE MARKET is facing declining sales. Is this really
the best time for a struggling company like Atari to 'bet the farm' on
a new console product?

The fact remains that theres a massive installed userbase for Sega and
Nintendo that they can rely on to be profitable for a year or two yet. The
Jaguar has NO base at a time of decline in console sales.

> : The 32X will outsell the 3DO easily this christmas.

> Possibly. The 32X will only have 6 games for it,

Hey, the Jagur was in that situation for over a YEAR! You can bet
with the support of Sega the 6 games on laucnh will rapidly grow to
a large library of quality software. Unlike Atari who have failed to
get games out in numbers.

> bucks to play 6 32X games insn't going to convince the masses. Even the
> Jaguar has more games.

Yes, but the Jaguar has been out for over a year now. And it doesn't
have many more games than this console does _on launch_. Plus of course,
DOOM will be available as one of the initial games. Now, will the games
buying public with millions of Segas spend 160 bucks on a spanking new
32X for their Megadrive/Genesis or will they ditch the platform they
know and go for a new product from a company with a record of poor
software support?

No, I don't NEED to buy a HD drive. Its a luxury item that
makes life easier if you are transferring a lot of stuff to
from PCs/Macs/Sun Workstations. Since it only costs 20 quid
more than a standard external drive, you might as well get
a HD if you are thinking of buying an external drive.

> of the Falcon vs. 1200 argument has been that anything the

> HD drive and then the MIDI ports....

Again, you may not NEED the MIDI ports. If you do, they are
only 20 quid and whats more, the MIDI unit I got for my Amiga at
that price is quite a bit more flexible than the ST ports - More
output ports and through ports and no need to fiddle around with
special cables.

These days, if you;re serious about MIDI you buy a Mac anyway.

Gavan,
By needing to buy a high density drive I meant that you do have to buy a high density disk drive for high density disks. Geez. With the price about the same for the Falcon and the 1200 how are you going to get a faster microprocessor, DSP and high density drive? Pay money of course. While you might claim that these are "luxury" features they do add quite a bit to the system. Software that uses the DSP is very neat-o (Griff's MPEG viewer for example). I don't have to really go into faster microprocessor or high density drives do I? Should I also mention the sound capabilities of the Falcon?(16-bit stereo, btw). Adding these capabilities on the Amiga would be expensive, would they not? How can you justify a 1200 now that the Falcon is competitively priced and it offers so much more? That every Falcon feature is a "luxury"? Please. Also bear in mind that as time passes and 1200s get harder to find the price will continue to rise.

Infini D is a joke. This is the program I used here in my college campus. OK, you can do some good stuff with it but "It's only second rate" like the song in Return of Jeffar seza ;-)

Try $$$Strata Pro$$$ which is if I am correct in the $2,000+ category.

No Sinclair. Let me add just this:

$400 - Real 3D V2.49. Please, look for an animation app on the Mac comparable to this.

The former is highly unlikely seeing as Atari are approaching the end of the dumping of their old component stocks. The latter is unlikely because C= aren't even a has-been International company (like an Atari) but an even more marginalised UK company. No chain will carry the stock of either as anything more than a clearance line, because no <new> owner would knowingly buy one in the face of what they'd be sure of getting in the more standard computing line.

A sad fact of life, but patently true nonetheless.

According to the latest MacWareHouse catalog(vol.35), Strata Studio Pro 1.5 is $899 plus $3.00 for over night shipping.

In 1995, Apple will incorporate 3d hardware on a single chip to be incorporated
in future macs and selected existing models. Suppose to be veryy inexpensive.

I probably have. Now Please look for comparable hardware that gives you more
bang for the buck and the Amiga loses handily on that.

No, you pay EXTRA to get a high density drive if you take the
Falcon path since Falcons cost MORE than equivalent A1200s.
As I pointed out, theres little need for most A1200 owners to
get a HD disk. Of all the meagre amount of software available
for the Atari machines, how much of it comes on HD anyway?
50% at best I'd say.

> With the price about the same for the Falcon and the 1200 how
> are you going to get a faster microprocessor, DSP and high
> density drive? Pay money of course. While you might claim that
> these are "luxury" features they do add quite a bit to the system.
> Software that uses the DSP is very neat-o (Griff's MPEG viewer
> for example).

Yes, they're impressive but also relatively unsupported by software.
And the Atari software support is abysmal compared to Amiga soft
and hardware support. Have you seen any 40mHz 040 cards for the
Atari? There are 3 for the Amiga. What choice do you have in fast
030 cards on the Atari? There are well over half a dozen brands
for the Amiga. Not to mention the games support is much better on
Amiga and serious apps I would consider better too.

> I don't have to really go into faster microprocessor

I wouldn't even attempt to try to claim the Falcon has a 'faster'
microprocessor than an A1200 if I was you. Faster clock speed - yes,
but with a 16 bit data path to memory and no ability to have
fastRAM the Falcons processor gives poor performance relative to
what a 16mHz 030 on the Amiga would give.

> or high density drives do I? Should I also mention the sound
> capabilities of the Falcon?(16-bit stereo, btw).

16 bit stereo is a nice facility. But again, the Falcon world
is hardly awash with titles which give noticeably better sound
than Amiga titles.

> Adding these
> capabilities on the Amiga would be expensive, would they not?

Assuming you wanted to add them.

> How can you justify a 1200 now that the Falcon is competitively

Because you can still get amigas here for 270UKP. The cheapest
Falcon I've seen is a 1meg noHD model for 400UKP.

Plus of course we still have a number of interested parties
trying to acquire the rights to make Amigas. There WILL be Amigas
manufactured again in the new year. If Atari went under, I wonder
would anyone bother to try to get the rights to make Falcons?

Cw Cross mentions marketing strategy?

Build a powerful computer, put them in all the computer stores they can (i also bought one early on - 9 years ago) (that was the rage - retail outlets) and then sit around and see wht happens. Address the niche market, but don't support software or peripheral makers?

I finally acquiesed and got an IBM for my business/writing stuff, just for all the access to everyone else's laserprinters/computers. I've been (and still) work (ing (oops, bad sentence)) on my Atari ST all this time and stillhave to go into the converstation about how it is *not* a game machine. Business in Germany, on and on.

Marketing strategy? Give up and try the game console market now that it's proven (again) to be profitable (and already locked up). I'm sorry, i've given up trying to explain why I still love my ST. I hung on as long as possible. I'm not a trader. I just feel alone. Peoplelike companies that support and act like they believe in their products. Evidence, atari. Hire a p.r. guy and convince us.

But I'm rambling.

roger

I would be positively delighted to provide press release sources. Apple are reducing estimates for the sales of the PowerFailure by nearly 40 to 50%. This information was sourced from articles in Computing (an IS trade magazine) and PC Week (another IS trade magazine that isn't just about IBM PCs).

The fact that IBM will be selling PowerPCs does not mean anything, as, the IBM PowerPC is NOT COMPATIBLE with the Apple PowerMac - do you know why?

Well I'll tell you anyway, Apple in their usual lack of wisdom incorporated a couple of extra chips in their machine which stops it being PReP compliant (PReP means Power Reference Platform). IBM are furious about this as you can imagine.

Barry.

The majority of prospective Jag buyers are likely to be too young to even know about Atari's sordid past. The industry rumours show that 32X is just a Sega stocking-filler and will get no real development for it, sure in its initial stages, but with their new console around the preverbial corner no serious software house will put their entire resources into developing for the 32X - surely they'd continue trying to explore the potential of the Jag and Saturn (which I believe they do already have development versions of).

> Power Reference Platform). IBM are furious about this as you can imagine.

Yep, as you state IBM definetely will NOT be selling powerFLOP clones
as their PowerPC machine is incompatible with Apples.

Actually, the rollout of IBMPC compatible PPC machines seems to
be under severe doubt. They were supposed to be out by now. I think
the truth is that IBM recognise that NO-ONE would buy PPC PCs unless
they offered real performance gains over the Pentium and that simply
isn't the case.

BTW, we got the insginia SoftWindows emulator for our Powerflop at
work and despite having a 7100/66 with 24 megs ram and 2 megs vram
the Windows performance is just plain appaling. I'd say 25mhz 386SX
at best. It _does_ work though,so you could work on it if you are
prepared to put up with extremely slow speeds.

Let me tell you the good and bad about the Jaguar:
It's got a lot of potential!
But it isn't getting used...
BTW, has anyone seen Alien vs Predator?
It's beautiful, but what about the playability? To fucking slow! Especially when you're trying to turn around. Either the Jag is too slow, or the programmers haven't done such a good job, they've just copied in some good graphics and sound. Too bad on such a good concept!
The best game so far on the Jag:
Tempest 2000
Probably the best to come:
Doom
Greetings to you all, and if anyone wants to give me a Jag, give me a call!
Sebastian Ringkvist, from Sweden!

4495. Let's talk about the Jag...

How many MIDI-net games do you have for it? How many games are there for
the Amiga that allow over 16 computers to be linked in to play a multi-
player game?
Thinking of the ST -
Midimaze - fun for up to 16 players
Midimaze II - even more fun for up to 64 players
MidiZap - sci-fi shoot em up for 32 players
HoverSpeed - 3 players only but still good play!

admittedly these are all shareware/freeware but heck, you can just pick up
any bunch of STs and link them together.

Gavan,
I was going by Richard Davey's statement that the 1 meg/no harddrive
Falcons are going for 300 UKP at Silica. This would make the
Falcon very competetively-priced. If this price is wrong then
I apologize. I am in the US so it is hard for me to keep up on
UK prices. Here in the States, in Amiga World I found one
advertiser list the Amiga 1200. It is _tough_ to find any 1200s
in the States.
Regarding programs that use 16-bit stereo sound there are quite
a bit of them. MOD players, sound recorders and editors,
MIDI programs. Some games coming out allow the playing of a
MOD in the background and this is a nice option, IMO.
About Amigas being made again- what source states that Amigas
will be made next year? Who will be picking up the Amiga?
C= UK? If this is the case, US users will most likely see
next to no support. I also would have to question if
companies with limited resources like C= UK could survive
very long in the personal computer market. My guess would
be no. I like Atari but their chances of making a comeback
in the personal computer world are slim.
If Atari goes out of business we will have machines most likely.
Atari already _has_ liscenced the technology to others to clone
the machine. We already have the Medusa. Also, GEMulator
on the PC and (hopefully coming soon) Mac Magix on the Mac
will allow one to run his/her Atari software on the two most
popular platforms. Can the same be said for the Amiga?
Yes, there are 040 and 030 accelerators for the Falcon. Quite
a few. The Barracuda from Wizztronics allows the Falcon to
be put into a nice new case with a '040 and the option of
486SX emulation. There are 32MHz add-ons which allow the use
of Fast RAM. There are many options.

>information about them!

Sure, no problem. :-)

When you add a datatype to your system, it registers itself with the datatypes library. (Actually, you either double-click it yourself and it will register, or you stick it in devs:datatypes where it will be executed at boot time.) When an application wants to load a file from disk, it asks the datatypes library to examine the file - the datatypes library in turn asks each datatype if it recognizes the file. If one of them does, datatypes library returns a success code and the relevant datatype. Once you have the datatype object that recognized the file, you can do any one of a number of things, which I'll explain below. Additionally, since datatypes are actually BOOPSI classes (ie. Intuition objects), they can be subclassed; for example, there is a Picture class, and the ILBM, GIF, JPEG, BMP, etc, datatypes are subclasses of it. If two datatypes are of the same subclass, you can use them for translating between two different formats (eg. JPEG -> GIF). Another class is the Anim class, which provides for playing animations in a window (or on a separate screen) sychronized with sound. A subclass of that is the IFF-Anim datatype, which is able to decode and play IFF-Anim animations. If you added, for example, a Cinepack datatype, you'd be able to play Quicktime movies that were encoded using Cinepack - ie. the Anim class and it's subclasses behaves very similarly to Quicktime and it's codecs on the Mac.

>>For those people who don't know, a datatype is a _universal_ piece of code to
>>handle a file type. For example I've got datatypes to handle GIF,JPEG,PCX
>>and IFF filetypes (sound,text,anim,etc datatypes are also available) this
>>allows any program which can handle datatypes to access any of the filetypes
>>with a corresponding datatype.
>
>What do "handle" and "access" mean in this context? What does your
>datatype code for GIF provide? Drawing to screen? Printing? Rotation?
>Access to pixel values? Loading and saving? Conversion into other
>formats?

Yes, yes, doesn't but could, yes, yes, and yes. Once you have the datatype for a file, you can ask it to convert it into the "raw" format for that class (eg. a bitmap in the case of the Picture class) and do whatever you want with that (eg. display it, access pixels, save it as another type, etc). Additionally, you could give the datatypes some window realestate and ask it to display itself with whatever extra controls it wants (so it could display the pic with some buttons to allow the user to rotate it, for example). An example of this is Multiview, which basically asks the datatype which recognizes the file to display it inside Multiview's window. The AmigaGuide datatype, when it displays itself, includes a row of buttons along the top that allow the user to nagivate through the document - these buttons are actually part of the datatype, not Multiview itself. Multiview has no idea what's going on inside the datatype, it doesn't even get any buttonclick messages when the datatype's buttons are clicked on - they're all handled separately by the datatype itself, running independently on it's own task. This was demonstrated rather dramatically to me once when I managed to crash an earlier version of multiview while reading a document over NFS - I couldn't quit multiview because it'd had a software failure and I'd suspended the task, but I could quite happily continue browsing the document it was looking at.

Currently installed on my system I have datatypes for 8SVX (an IFF audio format), AmigaGuide, BMP, FTXT (an IFF formatted text format), ILBM (an IFF picture format), MacPaint, post (Postscript), Windows Bitmap, X-Bitmap, Amiga .info File, ANIM, CDXL, GIF, JPEG, PCX, Sun Audio, and Windows Icon. That means that Multiview, or any other datatype-aware application, can access any of those types of files transparently, without having a clue as to their actual format (or - if you ask the datatype to display it itself and provide a GUI, even what the user is doing with it).

Object-orientation is neat. :-)

(I've set the followups to c.s.amiga.advocacy, since this is probably more than they wanted to know about datatypes already. :)

Actually, just read a few generic games mags. They all treat
Atari with derision, pointing out that virtually every time Atari
bring out a technically advanced machine, its a failure. People
DO remember their record on the Lynx and Falcon.

Its just one more obstacle for the Jaguar to overcome...

Apple said it will sell one million PowerMacs in the first 12 months and they
are on target. This was first spelled out when the powermacs were introduced.
Apple hsa repeately stated that they are on target to do so.

>
>The fact that IBM will be selling PowerPCs does not mean anything, as, the

IBM will be selling PowerMac clones. IBM will be selling versions of the
upcomming PCI Powermacs. IBM will be concentrating on corporate accounts.
PREP machines will not arrive until '96'.

>
>Well I'll tell you anyway, Apple in their usual lack of wisdom incorporated a couple

```
IC>recommend you get a copy of Digital Tracker (the new version) or even
IC>MegaTracker, both can have up to _32_ channels of 50kHz DSP replayed
IC>modules, they can handle S3M (ScreamTracker), MTM (MultiTracker) and all
IC>known ProTracker/NoiseTracker/Soundtracker formats. Something I doubt

I've downloaded the latest Digital Tracker and have problem with loading
S3M mods. At the end it says that they are corrupted. The modules are
fine because they load with Megatracker...
Also the MTM format is not supported on Digital tracker. Only on
MegaTracker and even that has some problems with timing...
On the other hand both play 32 channels.
Have you got any addresses for S3M or MTM mods on Internet?

Ah! I will buy a 1GB IDE hard disk. Is there a problem? I heard that
hard disks so big come with special software for the PC. Have you heard
anything?

Michael Papadopoulos.

In regards to MIDI multiplayer games:
I believe that Oxyd hooks up more than one machine as does
Shocker II. Also, there are PD programs allowing networking
of ST machines through the use of the MIDI ports.

Theres plenty of serial port link games available, admittedly
only two players at a time but lets face it, the ability to play
PD midi games over networks of up to 64 people isn't really a
going proposition for most home computer owners. Where are you
ever going to get 16 or more computers together? (I'm talking
in the Amiga/Atari context here, theres plenty of PC and Mac
lans around the place).

Its a nice fun feature, but hardly one which would contribute to
choosing a platform.

If you can get the base falcons for 300 quid then that is price
competitive so that removes one of the Amigas advantages. That
still wouldn't be enough for most people to buy one though. Lack
of software support and machine 'visibility' means most people
won't even think of getting a Falcon.

I gather it always was tough to get Amiga 1200s in the US. Blame
C= USs totally inadequate distribution and marketting.

Licensing out the technology was undoubtably a good move. Thats
another area where C= fucked up badly.

Sure you might be able to run Atari software on the Mac, but
since Amiga software tends to use the special hardware features of
the Amiga making and emulator on another machine would be difficult.
You can already run Atari software on the Amiga, but can you say
that an Atari could ever satisfactorily run Amiga software? No-one
has even managed to make a decent 8-bit Atari XL emulator yet, so
for an Amiga it would be even harder.

But nowhere near as many as on the Amiga. Plus there are Amigas
with proper boxes and an established 32-bit expansion bus. Something

which can't be said for the Falcon which has been hideously
underdeveloped.

: 50% at best I'd say.

Actually just checking my pd library there are hell of a lot of programs that would not physically fit on your precious DSDD disks. If we want to render a TIFF file or have one for import into Calamus they can be (and usually are) 900K in size and more - how the hell would we fit that on your DSDD disks. HD disks give a MUCH greater flexibility in the way we work, very enhanced compatibility with PC's and (obviously) a lot more storage space for a lot less pennies. Do the math.

: 16 bit stereo is a nice facility. But again, the Falcon world
: is hardly awash with titles which give noticeably better sound
: than Amiga titles.

Not exactly true, again you speak from inexperience. I have a couple of COMMERCIAL sound trackers which offer 32 channel stereo at 50kHz - full S3M (screamtracker) MTM (multitracker) and Protracker (Octamed included) formats. Very fast and very very high quality sound, with little processor requirements - why? Because they use the DSP. How do I know? Because I have an S3M module player running as an ACCessory on my desktop and it doesn't slow the machine down a bit. The sound is far superior to anything I have ever heard come from an Amiga - and yes I have heard S3M players for the A1200 and it does not sound nice. Oh these are full module editors with full MIDI support - NOT just players.

: Plus of course we still have a number of interested parties

: Again, you may not NEED the MIDI ports. If you do, they are
:only 20 quid and whats more, the MIDI unit I got for my Amiga at
:that price is quite a bit more flexible than the ST ports - More
:output ports and through ports and no need to fiddle around with
:special cables.

: These days, if you;re serious about MIDI you buy a Mac anyway.

But anything that you have to addon to your computer isn't going to be as
standard as somthing that is already in it. Take the PC for example,
where users have problems with Soundcards because there are many
different ones, with the ST and Amiga sound is built in as standard, so
no problems.

When programming MIDI for the Atari you know that the computer has MIDI
ports and what type they are etc..... If you have to add something onto
a computer (like MIDI ports, HD drive etc..) then the program will never
really know much about it. Time for problems I think.

Strange, theres more Amiga PD about and it all manages to fit OK
on DSDD disks.

The math dictates that you have to pay extra to get the HD disk
drive in your machine. The Falcon would be cheaper if it had DSDD
drives. And of course, if you want HD on the Amiga, its available as
well as Quad Density (3.5 megs/disk) which you can't get at all
on the Atari.

For best value, get your PD on CD. Theres stacks of Amiga PDCD
roms out there now,
17 bit collections (4 disks)
Fred Fish (2 disks + new disk every two months)
Aminet (3 disks, taken off the _standard_ Amiga internet FTP sites)
CDPD Collection (up to disk 4 so far)

plus various themed collections of games etc.

Well, I meant software titles in general, not dedicated mod players
(which originate from the Amiga incidentally). Where are all the multimedia
and games titles that use lots of 16 bit sound?

C= UK management and CEI as well as a German company ALL have bids
in and are competing for the rights to make Amigas. Whichever one
bids the highest, gets to make Amigas.

Take a look at 'Edge' and C&VG. Also the dedicated SNES and Sega
mags spare Atari no mercy when doing their hatchet jobs on the
Jaguar.

Since a large proportion of potential jag owners will already
have a sega/nintendo thats quite a bit of bad PR going Ataris way.

I spoke to a shop assistant in my local 'Game' store and he said
he liked the Jaguar, but everything Atari did turned to crap. Other
assistants concurred.

Gavan,
Just how many '040 options do you need? There are quite a few to choose from. I know of three different companies dealing with these kinds of upgrades.
Regarding emulation of the ST, where are these emulators? I have never seen one. Does Emplant have emulation of the ST ready? How fast does this run?
Yes, the Falcon cannot emulate the Amiga just as the Amiga can't emulate a Falcon. Remember, when the ST came out it was Cheap! giving it quite an advantage over the over-priced Amiga 1000. Now that the Atari line has moved into the 90's with the Falcon, we also have a few nifty chips like the DSP. Why would I want to emulate an Amiga anyway when I can emulate a PC?

You are wrong, the Atari AJAX FD-controller supports DD/HD aswell as ED
diskdrives. It is very easy to connect any of them to an Atari, as long
as you have the AJAX-chip.
The original FD-controller in Atari only supports DD-drives, and barely
HD-drives (a few have no problems whatsoever, while most of them need to
be replaced).

I can't think of any reason, to stick with a simple DD-drive, since
prices for HD-drives have dropped so much since it was introduced.
ED-drives are still very expensive, and with the current situation with
mass-storage devices (development, prices) there's really no reason at
all to buy an ED-drive.

Besides, the extra money I pay for a HD-drive in my F030 is well worth
it, even if I didn't get my F030 with a HD-diskdrive I would have put one in.

What I don't understand, is why you defend an obsolete storage-medium???
a simple Double Density Floppy may be cheap, but it is an old storage medium!
Is it because my F030 has got a High Density diskdrive, while your Amiga
hasn't?
(Penis-envy is the correct word for it, I think)

Regards, Tommy

: Strange, theres more Amiga PD about and it all manages to fit OK
: on DSDD disks.

What's strange? The fact that you can't fit a 1.4meg file on an Amiga
disk? Check my library, I have lots of titles which are compressed into
sizes of anywhere from 800K to the full 1.4meg and more - nearly all my
PD library is ZIPped so users get more on their HD disks for LESS money.

I charge a quid a disk btw (HD of course).

: The math dictates that you have to pay extra to get the HD disk
: drive in your machine. The Falcon would be cheaper if it had DSDD

Oh please... look in ANY PC rag, or Micro Mart, or Computer Shopper - how
much as HD internal drives? About 25 quid maximum. You think it would
make a whole lot of difference in the price if the Falcon had a DSDD
drive - give me a break! Anyone with some sense would get a HD drive
over a DSDD drive.

: drives. And of course, if you want HD on the Amiga, its available as
: well as Quad Density (3.5 megs/disk) which you can't get at all
: on the Atari.

Actually you CAN get ED drives and the software to use them (Ecopy Pro
springs to mind as a good commercial package that allows use of ED drives).

Anyway I have seen FTP sites that hold Amiga demos - DMS files, often
800K and more. So tell me - how do you get these onto an Amiga with a
DSDD internal drive? Unless your Uni has an Amiga linked up to the
network you have to use PC disks don't you? They format to what, 720K max.
If you don't have a HD drive in your Amiga that is. Then you have to
fiddle with CrossDOS to get the files over. The guy in my house
downloads all his stuff to HD disks, we copy it onto my Falcon and then
serial transfer it at 115,000 baud to his Amiga because spliting the
files, copying to PC disks, copying back to Amiga is a labourius process.

At least we don't get that problem. HD's are better than DSDD's, they hold more, they cost same price give or take a fiver. Now, try doing the math again please.

: For best value, get your PD on CD. Theres stacks of Amiga PDCD
: roms out there now,

Oh god - yes, yes, lets all rush out and buy a CD-Rom.... yet MORE expensive for your all-singing-all-dancing Amiga.

: Well, I meant software titles in general, not dedicated mod players
: (which originate from the Amiga incidentally). Where are all the multimedia
: and games titles that use lots of 16 bit sound?

They are NOT players - read the post - they are EDITORS. Geez.

Peter,
When you respond to my post please make the response somehow related to the original post. Otherwise, start your own thread! I was talking about how marketing does not make a product good or bad, just popular or unpopular. I also talked about the CD-ROM scene on the Atari.
You responded that people will buy Macs or PCs. This was totally unrelated, not to mention pointless. I think most people on the Net realize that PCs and Macs outsell Ataris and Amigas by a fair amount.

That's not the point he's making, (I think). We have both an IBM model
25T and a Power(sic)FLOP(not sic). The 25T blows away the 7100. Maybe
it's because it's running a halfway-decent OS ?

Umm, no it doesn't. It may have a *slight* edge, but by no stretch of
the imagination does it kick the 1200s arse.

>:>> or high density drives do I? Should I also mention the sound

Again, no it isn't. It *is* nice, but for most people a 44KHz 8 bit
sample through a DECENT DAC is as good as a 16 bit one. (Note "decent",
so SoundBlasters don't count, and neither does the STE.)

No I don't. I either plug it into the expansion bus or into the PCMCIA slot.

I have seen it. There are a couple of interesting games, but still...

[stuff deleted]

|> According to the latest MacWareHouse catalog(vol.35), Strata Studio Pro 1.5 is
|> $899 plus $3.00 for over night shipping.

I wonder if Strata guys just realized how overpriced their software was.
BTW, Peter, isn't this the PowerPC version or what? I am asking you
because just 3 weeks ago there was a dealer in this campus showing
Strata Pro's prices... they WERE NOT $899.

|> In 1995, Apple will incorporate 3d hardware on a single chip to be incorporated
|> in future macs and selected existing models. Suppose to be veryy inexpensive.

OK, now I'll admit you peeked my interest. Let's see when it comes out
and with what it comes out. A PowerPC 604 machine with that.. and
IF IT IS Really inexpensive (I wouldn't give a damn at an over $4,000 machine),
then that would be interesting.

|> > No Sinclair. Let me add just this:
|> >
|> > $400 - Real 3D V2.49. Please, look for an animation app on the Mac

|> I probably have.

No, I think you haven't. Inverse kinematics, collision detection,
fractal noise forces? CSG math primitives with boolean operations? The

last Strata Pro specs I read didn't had a hint of that.

|> Now Please look for comparable hardware that gives you more
|> bang for the buck and the Amiga loses handily on that.

Well, don't you think I do? Believe me, I was not impressed
by the PowerPC version of Inini D on the PowerMac. My Real 3D
on my humble '030 @50mHz even came extremely close to a 68040 @ 40Mhz
Quadra Mac! The PowerPC version was about 3-4 times faster in the
test I did, and that's how faster Real 3D is on a 68040 Amiga!

|> > Yes, it's expensive, but it doesn't make sense for me to buy a PowerMac

The software is accelerated for Powermacintosh. I guess MacWarehouse has
greater buying power than your local dealer. I have noticed that Amiga video
software is moving up in price as well.

Well a faster PowerMac 8100 was releases last thursday running at 110mhz. But
is very pricey at $6300 with two gigs of storage and 16 megs of memory and with
cdrom..

4536. Jaguar gone Retail

Newsgroup: comp.sys.atari.advocacy
Date: 1994-11-06 05:30:32 UTC
From: ericw@okcforum.osrhe.edu
Message-ID: <39hplo$bvb@romulus.ucs.uoknor.edu>
Source record: 14924

I am still in shock. I opened up Sundays paper and what to my surprise, a
Jaguar on sale for 229.99. First I am in Oklahoma and the Jags are here.
Second a Retail store is carrying them. Venture (the retail chain) has
them advertised in their national flyer and they have all the fgames 15%
off too.
Now I know that Venture isnt the largest retail store in the US, but
it it a pretty large one and it is growing. If Venture carries it I wonder
who will be next. I remember reading a messagte here that said the Jag
wouldnt make it unless it got picked up by the retail giants, well here is
a start. Wal-mart (the largest retailer) and Target (the fastest growing
retailer and the third largest) might be soon on the way to get them..
Total shock.
The games they have listed are
Tempest for 50.99
Wolfenstien 3d 50.99
Raiden 42.49
Trevor McFur 42.49
Alien V. Preditor 59.49

The system comes with cybermorph and by mail you can get a free Dino Dudes.
All for 229.99

4538. :JAGUAR and CHRISTMAS & CHRISTMAS & CHRISTMAS etc

Newsgroup: comp.sys.atari.advocacy
Date: 1994-11-06 16:48:00 UTC
From: game.guru@teaminfinity.com
Message-ID: <76.540.249.0N966C76@teaminfinity.com>
Source record: 14842

Hello !

JAGUAR's 2nd CHRISTMAS is rapidly approaching !!!!!!!!!!!!!!!!!!!
can you believe it ? We were ranting and raving last
CHRISTMAS as well, and cannot believe yet another is upon
us and NO FRIGGIN CDROM, etc etc etc etc etc etc etc.
Talk about Demolishing Opportunity !!!!!!!!!!!!!!!

CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS
CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS
CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS
CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS
CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS
CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS
CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS
CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS
CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS
CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS CHRISTMAS

It would seem to us that getting more titles out quickly
might be IMPERITIVE at this juncture. Even if it means
spending 3 times what is normally necessary as this could
be make it or break it time. The hardware lead is rapidly
being devoured and one cannot expect the competition to sit
idly by.

Makes you wonder. Pennywise pound foolish. Think of the
CHRISTMAS Tree and whose game machine is under it.
People are going to buy game systems you better believe it !
Not only did you not sell a machine, but worst than that, a
competitor's machine is under the tree AND once that initial
investment is made, it is HIGHLY Unlikely they will switch after
buying even a couple of cartridges.

32X, DKC, Sony, CDI, Saturn, Reality, upcoming hardware,
3DO all bode ill for a slow Jaguar Development process.

We are squarely behind ATARI. We are stockholders and
Licensed developers, and retailers, we feel great alarm
and do not want to be disappointed and thus are calling on
all to get the word out that time is of the essensce and
that this CHRISTMAS especially is very important ! Let
ATARI Know.

Copy at will.

One might not think stating the obvious is important, but
sometimes it needs stating abundantly.

Bingo. SinCrap just said something about a 110MHz mac (how the HELL
do they get THAT speed?) ...

it *still* wont matter if you're running system 7.

If you pour enough sugar on a pile of shit before you eat it, it'll be
sweet, but in the end, you're still eating a pile of shit.

Scott

Peter, you should read a Pentium clonse vs PowerMac comparison
on an issue of Computer Shopper (august? Summer?), where the Pentim
clones basically outperform the PowerMacs at pretty much everything except
ImageProcessing or heavy floating point stuff. In most common applications
they were blown away by Pentiums, and this is thanks to 80% of the
apple's system 7.xx not PowerPC recompiled.

Where? How Amiga video software is moving up in price? LightWave
is the one at $1,000 which was just released. And again, it blows
Mac stuff away. So does Real 3D... Now, I just heard LIghtWave is
being ported to the PowerMac, and that's interesting... but talking
about the present...

|> >|> In 1995, Apple will incorporate 3d hardware on a single chip to be incorporated

Really, I saw Orbital using an ST on television last night. BTW if you didn't know Orbital are one of Britains best and most succesfull techno/rave groups. If they aren't serious about MIDI I don't know who is. Just goes to show that some people will use an ST if that's what they're used to, and not feeling that they HAVE to switch to a Mac/PC/Amiga just because everyone around them is shouting ATARI ARE CRAP, you MUST get a new computer.

Arggggggg, have you ever stopped to think that when people have this kind of attitude it's no wonder that there's so much pessimism about the Jaguar. It's a nice machine, Atari just need to get their act together, and they need support. Actually saying that I'd be suprised if the Jaguar is a succes in the UK this Christmas, but you never know.

All software that needs sound on the Falcon will use 16 bit sound and even if it uses 8 bit it still sounds great. BTW Gavan I like digitracker which gives me full 32 channel sound at 50KHZ and I like the way I can just connect my HiFi to my Falcon with a simple cable and sample directly into DigiTracker. OK, you can do that on the Amiga, but then you have to decide which sampler to buy and does all my sofware support this sampler etc. etc.

BTW don't cry Gavan just because .MODs originated from the Amiga, S3M tunes came from the PC and offer 32 channels, where's the 32 channel Amiga module format???

Alan.

That's the biggest difference between Falcon's and A1200's - we get all
these features THEY have to buy! We already have the DSP, god knows what
Amiga software supports them anyway. We have the SCSI-II ports, how much
for an A1200 ? #150 quid being generous, what about upgrading the A1200
interal DSDD to a DSHD - another 80 quid. Then how about connecting to a
SVGA monitor? What about a sampler? 16 bit of course, 8 bit for about
20-30 quid, 60-70 for a 16-bit though. So lets evaluate this again please:

A1200 2 meg memory, no hard drive - 220-250
+ 16 bit sampler - 60 quid
+ SCSI-II ports - 150 quid
+ internal DSHD - 80 quid

Hum let me see, thats like over 500 uk pounds already. Do you see where
I am going now? The Falcon with 4meg memory is 499 from selected outlets.
You are still 2 meg memory short in that listing and I doubt you could
get those products for the prices I state, probably more. At least the
Falcon gets THEM ALL and ALL BUILT-IN. Oh and we also have built-in
Genlocking hardware, just time until someone explores that avenue too.

: BTW don't cry Gavan just because .MODs originated from the Amiga, S3M tunes
:came from the PC and offer 32 channels, where's the 32 channel Amiga
:module format???

s3M's are amazing quality, some of the tunes are like WOW!!! :-)

Who the hell takes the Edge seriously? Did you see the uproar in their latest issue over the AvP review? Do kids buy the Edge to base their gaming purchases on? Hell no!!! Edge have gone a stage too far, they are at the stage where not only is present technology ignorant of the abilities they 'require' but so is what is coming... Edge plan too far ahead which makes it a nice 'culture shock' magazine but not a lot else.

C&VG are very pro-Jag actually, just read it.

:>a computer (like MIDI ports, HD drive etc..) then the program will never
:>really know much about it. Time for problems I think.

:But MIDI ports are nothing more than serial ports with a funny connector.
:There's no room for confusion.

Well, ther're a bit more complex than that :)

But I'm talking about the actual interfacing between the ports and the
OS, if the computer doesn't have things as standard, there's a lot of
messing about when you do add them, and maybe a lot of problems when more
than one company brings out the extra. Remeber how many problems PC
users have with things like soundcards not being recognised etc... You
can imagine the same things happening when added HD, MIDI ports, DSP etc..

It's better to have something as standard, then eveything knows what's
what, instead of having different companies with different standards etc..

Well that's how i see it anyway :)

4558. Guess what, Sinclap! Apple's going under!!

Newsgroup: comp.sys.atari.advocacy

I found this in c.o.o.a. It has some very enlightening info about Apple that
I think one Peter Sinflop-Day should know.

->System 7.x runs very slow on the PPC in emulation. Apple doesn't even have
->plans to port it and says it cannot afford to do so. To avoid two PPC
^^^^^^^^^^^^^^^^^^^^^^
->standards a new Post-prep standard has been worked out. But Apple cannot
->afford to adapt its OS to the Post-PreP standard. IBM will help.

So Apple is having cash problems! No wonder they are always having fire sales!

->BYTE magazine benchmarks last April showed that emulation shows some programs
->to only 1.6% of the speed they would have if they ran native. If any of Apples
->OS has to be emulated, it will become a bottleneck that slows performance.

SLOWED DOWN OVER 98% UNDER EMULATION!! PowerFlops must be great!! I bet they
would run MacPaint slower than the original Mac. Or WordStar slower than the
original IBM PC (assuming there was a Mac version of WordStar, that is).

->The PPC chip is slower than the Pentium in interger processing, which is what
->counts. Furthermore, Intel's P7 chip will be full RISC and a match for the PPC.
->Windows NT and the MS apps can be easily recompiled to run native on the P7.

If any of the above is true, than the PC clones will soon kick the PowerFlop off
the planet!

->Apple and the PPC are IN TROUBLE. What user is going to run in emulation when
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
->MS and MS apps run native on equally fast Intel chips?

I smell a new C= in the making. :-)

->IBM will probably help Apple convert its OS to something that will run on the
->Post-PreP standard. That way a unified PPC standard will have a chance of
->competing with Intel.

First Apple needs IBM's help to get a microprocessor that meets PC standards, and
NOW they need IBM's help to port THEIR OWN operating system. Makes me wonder...

So, Peter, when do you think that bankruptcy hearing will be scheduled?

Let's talk about yet another possiblity - an ANSI C cross-compiler
and a serial connection to a host computer. At $250, the Jaguar HAS
to be easily the cheapest chunk of compute power going right now.
It may not me a standalone machine, but it would sure make an amazing
rendering engine! Any takers for this development idea?

Looks like there are 600,000 stupid people out there. People who don't know that the current crop of PowerFlops will soon be obsolete (PCI ones just around the corner. Ones conforming to this new joint IBM-Apple standard (assuming it isn't bullshit) starting in 1996. Ones that will (assuming Apple isn't actually close to bankruptcy) run a *100%* native operating system.

>Apple has released a 110 mhz

Yea, Computer Shopper is a PC publication full of clone ads. So their
credibility is in question. I have seen demonstrations were a Pentium acts
like a Yugo compared to a PowerMac..

Try again.. Read carefully...

Apple Computer Announces Record Revenues and Improved Earnings

CUPERTINO, California--October 17, 1994--Apple Computer, Inc., today announced record revenues and significantly improved financial results for its fourth fiscal quarter, which ended September 30, 1994.
For the quarter, Apple's revenues were $2.49 billion, a 16% increase over the fourth quarter a year ago, and represented the highest quarterly revenues in the Company's history. Net income for the quarter was $114.7 million, or $0.95 a share compared with $2.7 million, or $0.02 a share in the same quarter a year ago. The Company also announced that quarterly unit shipments had exceeded the one million unit mark for the second time in company history.
"Over the last 12 months we have significantly restructured the Company, demonstrated our new competitiveness, and delivered these record results," said Michael Spindler, Apple's president and chief executive officer. "Apple has positioned itself in several rapidly growing parts of the industry. We have taken the volume lead in RISC-based computing for graphics and business, and we are setting the pace in multimedia-based computing for the home and the
Apple attributed its high unit shipment figure to strong demand during the quarter for its multimedia-based Macintosh 630 products, its PowerBook 500 series of portable products, and its Power

Macintosh desktop products. Strong demand has led to a shortage of some Apple products, a situation the Company is working to improve in the first fiscal quarter of 1995.

Apple announced that during the quarter it shipped more than 250,000 Power Macintosh personal computers and upgrades, bringing the total unit figure to over 600,000 units shipped in the first seven months since introduction. The Company has set a goal of shipping one million Power Macintosh personal computers and upgrades in the first 12 months of availability.

During the quarter, developer support for the Power Macintosh platform grew. There are now nearly 300 Macintosh applications on the market which have been optimized to take full advantage of the high performance of the Reduced Instruction Set Computing (RISC)-based Power Macintosh system. Recently announced applications for the Power Macintosh include Microsoft Excel, Adobe Photoshop, Aldus Persuasion, and Claris Corporation's MacWrite Pro.

The Company's improved earnings, compared to the fourth quarter a year ago, were the result of strong revenue growth combined with operating expenses.

Gross margins improved to 27.2% of net sales in the fourth quarter of fiscal 1994 from 25.7% of net sales in the same period a year ago. The improvement in gross margins was due to both higher production volumes and the positive impact of new product introductions, including the PowerBook 500, Macintosh 630, and Power Macintosh.

Operating expenses for the fourth quarter were 19.6% of net sales, down from 25.4% of net sales in the fourth quarter a year ago, and represented one of the Company's lowest operating expense ratios in its history. The improvement in operating expenses as a percentage of net sales was due in large part to cost reductions coming from the Company's restructuring activities over the last 12 months.

Inventories at the end of the fourth quarter were $1.09 billion, a reduction of $418.2 million from the fourth quarter a year ago. Cash and short term investments at the end of the fourth quarter stood at $1.26 billion, an increase of $365.6 million compared to the fourth quarter a year ago. Total borrowings at the end of the fourth quarter were $596.7 million, a reduction of $233.6 million from the fourth quarter a year ago.

For Apple's fiscal year ended September 30, 1994, revenues the year was $310.2 million, or $2.61 a share, compared with $86.6 million, or $0.73 a share in fiscal 1993. Included in the Company's results for fiscal 1993 was a charge of $320.9 million ($198.9 million, or $1.72 per share after taxes) for restructuring and other expenses. Included in the Company's fiscal 1994 results is an adjustment to earnings of $126.9 million ($78.7 million, or $0.66 per share after taxes) related to a reduction in the Company's estimates of the costs associated with its restructuring activities.

Apple Computer, Inc., a recognized pioneer and innovator in the information industry, creates powerful solutions based on easy-to-use personal computers, servers, peripherals, software, online services,

and personal digital assistants. Headquartered in Cupertino,
California, Apple (NASDAQ:AAPL) develops, manufactures, licenses and
markets products, technologies and services for the business,
education, consumer, scientific & engineering and government markets
in over 140 countries.

PCI PowerMacs will not be around until May/95. People want speed today. Plus
the current crop will have a motherboard swap upgrade. Even the all in one
Peroma will have a PCI logic board upgrade. Can't say that for the A1200 and
the falcon..

:original IBM PC (assuming there was a Mac version of WordStar, that is).

1.6? I think that's a tad overstated. I run a bunch of things in emulation
and it's most certainly not 1.6%. But the native stuffs coming out and
needless to say, it kicks ***. BTW--it's not a bottleneck in the OS if its
not used. As I said, the parts that are used the most will be ported.
:
:->The PPC chip is slower than the Pentium in interger processing, which is what
>counts.

Roughly equal, from what I've heard. And PPC is much better in FP.

:->Furthermore, Intel's P7 chip will be full RISC and a match for the PPC.

Full RISC? I certainly hadn't heard about this, but I don't pay much
attention to the IBM chip market. Besides, the P6 has to come out first
and the PPC certainly won't remain static. We're talking two years before
the P7, atleast, would be my guess.

:->Windows NT and the MS apps can be easily recompiled to run native on the P7.

Same with Mac apps. Your point?
:
:If any of the above is true,than the PC clones will soon kick the PowerFlop off
:the planet!

You know...this is beginning to sound like flamebait...
:
:->Apple and the PPC are IN TROUBLE. What user is going to run in emulation when
: ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
:->MS and MS apps run native on equally fast Intel chips?
:
:I smell a new C= in the making. :-)

And what authority said this? As I said, guess what? Mac programs can be
recompiled too!!! Wow. Isn't that neat!
:
:
:->IBM will probably help Apple convert its OS to something that will run on the
:->Post-PreP standard. That way a unified PPC standard will have a chance of
:->competing with Intel.
:
:First Apple needs IBM's help to get a microprocessor that meets PC standards,

So? Motorola's always done Apple's microprocessors. Last I checked, Apple
didn't have a microprocessor division.

: and NOW they need IBM's help to port THEIR OWN operating system. Makes me
:wonder...

I haven't read the article on the new PreP, so I won't comment on it. The
above sounds like stating something out of context to me, though.
:
:
:So, Peter, when do you think that bankruptcy hearing will be scheduled?

You know what? I think this was flamebait. Sigh. I already typed this.
Might as well post it...

Falcon and Stunt Car are also on Amiga.

What about LOTUS II then? You can have 4 players, 2 on each machine.

Your mate has a single floppy A1200 doesn't he. Splitting files across
multiple MSDOS disks and recombining them on such a system is indeed labourious.
I should know, I used to do it when internetting files down to my Amiga
via PC disks. Of course, when you get a hard drive it becomes a LOT easier.
Plus of course, many FTP sites for the Amiga will use the in-built splitting
of DMS to produce two <720K file chunks. Of course, the best way is to use
SPLTIZ and JOINZ as you get versions for Amiga, PC and Mac.

But youre right, One of the reasons I'm going to make my second drive
a HD drive is because I want easier xfer between PC and Amiga. In fact, its
the only reason. I need a second drive anyway and since HD drives are 60 quid
as opposed to 50 quid for a DD drive I figure I might as well make it HD
and make my life easier wrt to PC file xfers.

Your friend might find things a lot easier if he just spends the 50 or 60
quid to get an external drive for his A1200 (either DD or HD).

> At least we don't get that problem. HD's are better than DSDD's, they

> : roms out there now,

> Oh god - yes, yes, lets all rush out and buy a CD-Rom.... yet MORE
> expensive for your all-singing-all-dancing Amiga.

You do the math. A CD drive with a PD CD works out a LOT cheaper than
buying the equivalent PC on floppy disk. Of course, on the Amiga you get
a good choice of CD ROM product, this might be less true on the Falcon
so maybe a CDROM drive wouldn't be as good a bet.

> : Well, I meant software titles in general, not dedicated mod players
> : (which originate from the Amiga incidentally). Where are all the multimedia

> : and games titles that use lots of 16 bit sound?

> They are NOT players - read the post - they are EDITORS. Geez.

So where are the multimedia and game titles then? Whats the choice like in multi-track direct to hard disk digital editing software too? I'd imagine there should be quite a choice by now.

Oh, and wheres that DSP software modem that falcon owners have been mooting since day one?

Sorry, where does that leave product for ST owners then? I was under the
impression that they used DD disks? Some even use single sided DD disks (a
friend has an old STFM with such a config). So I'd say that saying 50% of
Atari computer product coming on HD disks is _over_ optimistic if anything.

Not for general purpose word processing, compilers, databases, spreadsheets
and games it doesn't.

For digital signal processing, it does. Possibly something to do with
the DSP.

> :>> or high density drives do I? Should I also mention the sound
> :>> capabilities of the Falcon?(16-bit stereo, btw).

> multi-media machine.

Whats essential for a modern multi-media machine is (a) Authoring software
and (b) End user multimedia titles.

The Falcon is notably lacking in BOTH these areas.

You want 16 bit stereo sound, then add a CD rom drive as you'll need
it to store all that data. Whoops! But then you can just play the audio
straight from CD as the CD32 does (or any Amiga with CD ROM, or any
PC with CD ROM).

> :>> Adding these
> :>> capabilities on the Amiga would be expensive, would they not?
> :> Assuming you wanted to add them.

> you don't want a 96mops dsp? do you need to buy a scsi interface to plug
> a cd-rom into your 1200?? (laughs)

Well, you can buy a Zappo CD/Overdrive CD which just plugs into the
PCMCIA slot. Or you can get a third party PCMCIA<->Mitsumi interface.

Of course, to plug a SCSI in you have to buy one of the many SCSI
interface cards but I'd rather pay for my SCSI when I need it, than pay
for it when I buy the machine regardless of if I need it or not.

> :> Plus of course we still have a number of interested parties

> :>manufactured again in the new year. If Atari went under, I wonder
> :>would anyone bother to try to get the rights to make Falcons?

> The Falcon hardware is already licensed by Atari, so your wrong on every
> point (again) Gavan..

Wow! Who are making all these falcon clones then? I don't see any ANYWHERE.
Hey, I don't see Falcons by Atari anywhere either. Theres NO CHANCE of EVER
seeing the Falcon in mass production. Its a niche machine that gets more
dated by the month. If the Amiga doesn't get picked up/developed, then
you might be able to say the same about it in a years time but it has had
a lot more development put into it than the Falcon ever had. What other
company would release a machine and then do NOTHING to develop it, dropping
all work on it to concentrate on a GAMES CONSOLE?????

If Atari ever do make another home computer, you can bet it won't havbe
anything to do with the Falcon.

> SVGA monitor? What about a sampler? 16 bit of course, 8 bit for about
> 20-30 quid, 60-70 for a 16-bit though. So lets evaluate this again please:

SCSI - 70 UKP for your 030 acclerator card or internal IDE<>SCSI card.
HD drive - 60 UKP for external second drive.
16 bit sampler - currently about 100 quid for the awful microdeal
box. But hey, I have an 8 bit sampler that only cost me 30 quid.
Good quality too, but I almost never need to use it. A nice toy,
but I'm glad I didn't spend my money on a 16 bit one that I wouldn't
use.

> Falcon gets THEM ALL and ALL BUILT-IN. Oh and we also have built-in
> Genlocking hardware, just time until someone explores that avenue too.

Duh! You have the same genlocking capability that the A1000 had from
day one. Stick to audio, you obviously have no idea about video as thats
the Amigas field.

Our PowerFLOP at work runs at 66mhz and its still pretty slow. A 110Mhz
one should get the Mac back to the level of about a 33mHz (maybe 40) 040
quadra, which was where it was at before they started making the powerFLOPs.

I'm not so sure the RISC chips in the Jaguar would be suited to
the sort of computing that you need for ray tracing etc. Theres also
the problem of a lack of RAM in the actual machine for doing computing
tasks.

The US prices you quote are the same as the UK prices except that they
have undergone a pound for dollar exchange.

ie Jaguar @ 229USD = 229GBP.

I think someone, somewhere is being ripped off. It would surely be
in Atari interest to sell the machine as cheaply as possible in the UK
to gain market share.

Yeah most Apple CD-Rom games (or MOST CD-Rom games) are all gloss,
complete toss. Pretty pictures don't a good game make, yet suckers buy
them by the bucket-load. Perhaps our acceptance levels of what makes a
good game has dropped in the last 5 years? Who knows but its getting
very sad.

4579. The slow Jag

Newsgroup: comp.sys.atari.advocacy
Date: 1994-11-08 11:33:29 UTC
From: IE9390@lthmalmo.malmo.lth.se
Message-ID: <IE9390.24.000C8F3B@lthmalmo.malmo.lth.se>
Source record: 14874

The magazines says that Atari's doing great with the Jag in the USA. Is this true? Well it seems to take ages in europe before the Jag will ever be a platform... And if they want to sell the Jag at large amounts, they'd better make it cheaper! Here in Sweden, you'll have to pay about ?300 for the Jag! And ?80 for each game! Who the hell want to buy that!? At least the games must be cheaper than Nintendos shit!! Here SNES and SEGAs just costs about ?100, and the games from ?30-60!
And it's not like any store tries to push it - they
just go along with Nintendos and Segas popularity.I don't know how good the Jag really is, but it has to be better then 3DO or any 486 PC in order to have any point to come with. And it has to have the games that shows this capability! Even I am not going to believe Ataris crap statements about the hardware capabilities - they sure haven't been shown in any game yet! (Alien vs Predator, for example, with its realistic sounds and graphics, should be as fast and playable as DOOM or Wolfenstein3D on the fastest 486, if the statements were true!!!)
I think the magazines are lying! They say Atari's signed up with hundreds of developers for the Jag, but this sure hasn't shown... The same story was for the Falcon, and we all saw how true that was...

>->System 7.x runs very slow on the PPC in emulation. Apple doesn't even have
>->plans to port it and says it cannot afford to do so. To avoid two PPC
> ^^^^^^^^^^^^^^^^^^^^^^

Apple didn't want to spend a lot of money porting the Mac OS to Prep --
an architecture with few users and even less software support. System 8 will
be mostly native except for a little legacy code that new programs
shouldn't use any way.

>->standards a new Post-prep standard has been worked out. But Apple cannot
>->afford to adapt its OS to the Post-PreP standard. IBM will help.

>So Apple is having cash problems! No wonder they are always having fire sales!

No, Apple hasn't lost money a single year since 1985 and last quarter it
had a 110 million dollar profit. They just don't want to waste money on
Prep which has no third party software support or users to speak of.

>->BYTE magazine benchmarks last April showed that emulation shows some programs
>->to only 1.6% of the speed they would have if they ran native. If any of Apples
>->OS has to be emulated, it will become a bottleneck that slows performance.

>SLOWED DOWN OVER 98% UNDER EMULATION!! PowerFlops must be great!! I bet they
>would run MacPaint slower than the original Mac. Or WordStar slower than the
>original IBM PC (assuming there was a Mac version of WordStar, that is).

Worse case performance that I've seen benchmarked is running emulated
680x0 instructions using integer math and thats the speed of a 68030-25
on a 6100/60. But who cares when all of the major dtp and graphics
programs are already native and most of the business software is native?

>->The PPC chip is slower than the Pentium in interger processing, which is what
>->counts. Furthermore, Intel's P7 chip will be full RISC and a match for the PPC.
>->Windows NT and the MS apps can be easily recompiled to run native on the P7.

You're comparing vapor -- the P7 -- to shipping products? The 620 which
is already shipping in limited quantities is faster than even Intel
predicts the P7 will be.

>If any of the above is true, than the PC clones will soon kick the PowerFlop off
>the planet!

Thankfully little of the above is true.

>->Apple and the PPC are IN TROUBLE. What user is going to run in emulation when
> ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
>->MS and MS apps run native on equally fast Intel chips?

No user would choose to use emulation when all of the most popular
software available for the Mac, except for MS-Word, is native.

>I smell a new C= in the making. :-)

Let's see, Apple just had $110 million profit, was the number one
computer seller in the US last quarter and number 2 in the world.

>->IBM will probably help Apple convert its OS to something that will run on the
>->Post-PreP standard. That way a unified PPC standard will have a chance of
>->competing with Intel.

>First Apple needs IBM's help to get a microprocessor that meets PC standards, and
>NOW they need IBM's help to port THEIR OWN operating system. Makes me wonder...

What difference does it make if Apple uses chips made by IBM? You could
just as well have said that Apple needed Motorola to get a processor to
meet PC standards. Apple has never made its own processors.

IBM is helping Apple port the OS to prep. Apple could care less for Prep
now probably. Especially since its lining up its own clone makers.

This day sucks. Peter is right (yes, I said that right). Have the groups I read actually become so bad that Peter can actually use facts to prove someone wrong. Apple has made a good deal of money, the PPC is a really good machine (even under emulation, but there is no reason to run under emulation). Apple needs some work, and they seem to be going in a good direction (although sys7.5 should not have been released because it is real slow, and buggy).

4582. Ataris Present Situation

Newsgroup: comp.sys.atari.advocacy
Date: 1994-11-08 16:28:38 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <39o8vm$gd9@dux.dundee.ac.uk>
Source record: 14777

It seems to me Atari are in the shit so to speak. Lets look at the
facts:

Jag Sales 100-200k units this year that equates to about
$60,000,000 in console sales. ($300 each)
plus probably at very most the same again in cartridge sales.
Also the computer division probably about $25,000,0000

Total $145,000,000us. (at the very most)

This isn't very much when you consider that Nintendo sells about
$4bn worth of stuff each year.

If Atari don't do some serious marketing and back up their products
with technical support, upgrades and access by developers to sales and
technical info than I give then at most 2 years.

>Apple said it will sell one million PowerMacs in the first 12 months and they
>are on target. This was first spelled out when the powermacs were introduced.
>Apple hsa repeately stated that they are on target to do so.
>
>>
No they haven't. Apple are quote disappointed with the market take up of the
PowerMacintosh unqoute. Apple are now predicting that there will be a huge rise
in people purchasing PowerMacintosh over the Christmas period.

Computing placed this theory under serious doubt as, traditionally, the Xmas
period is when PC compatible, console and home computer sales take off, NOT when
Macintosh sales increase. Apple has nearly always had fairly consistent sales
throughou the year so there is bo reason to expect the PowerFailure to have a
sudden surge in sales.

>>The fact that IBM will be selling PowerPCs does not mean anything, as, the
>>IBM PowerPC is NOT COMPATIBLE with the Apple PowerMac - do you know why?
>
>IBM will be selling PowerMac clones. IBM will be selling versions of the
>upcomming PCI Powermacs. IBM will be concentrating on corporate accounts.
>PREP machines will not arrive until '96'.

Really??? Where precisely did you get this 'information'(???) from?
According to sources from IBM, Big Blue is delaying releasing the PowerPC until
their port of OS/2 warp is complete. When OS/2 has been ported across then they
will release PReP compliant machines, cuurently IBM are saying that the PReP machines
will be released in Q1 of next year. Other manufacturers are also looking into
having PReP compliant machines by Q2 or Q3 of next year.

IBM will categorically _NOT_ be releasing PowerFailure clones. For them to release
these they would have to include on the M/Board several of Apple's custom OS chips
- something that an IBM spokesman stated that they would _NOT_ be doing.
Another question - what _exactly_ did you mean by 'IBM will be concentrating on
corporate accounts' like so many of your statements it has no meaning. Do you
mean corporate accounts as in Audits, do you mean corporate accounts as in clients
or maybe you are referring to IBM's own internal audits - learn to speak English
Peter it will make your arguments considerably more lucid (although still plain
dumb).

ower Reference Platform). IBM are furious about this as you can imagine.
>
>IBM and Apple have already decided on a standard. Boy, news travels slow to
>your nake of the woods..
>
Yes, the standard is called 'PReP' (here we go again) PReP is the _only_ standard

that links all of the machines based upon the Motorola PowerPC microprocessor.
By including certain ROMS into the spec Apple actually broke the PReP standard.
PReP is fairly leniant on everything except the OS standards - which is basically
what Apple changed...

Presuming that you meant my 'neck of the woods' well, let's face it. I don't have
you anywhere near me spewing out complete and utter crap at the first sign of a post
that might question your beloved Macintosh.
Frankly no one minds you spouting about the Mac except when you are
1) Making it up and hence talking rubbish.
2) Change a thread from one thing (about the Jaguar for example) to another, just so
you can rub the Mac into everyone's faces.

To be perfectly honest we don't like you! Go away Peter - find another group to
annoy.

~ The Independant Magazine for users of the Calamus DTP Package ~

If you are a user of the Calamus DTP package you will undoubtedly be Interested to learn of the arrival of an Independant Magazine totally dedicated to this "Great Professional" Desktop Publishing Program.

This Magazine Is available on a quarterly basis, in an A4 mono format with a minimum of 14 pages per issue.
The aim of this magazine is to help you, the user to gain the most from your investment. CALAMUS USER will act as a platform for users to help to offer others and exchange ideas. Whilst keeping you informed of the latest events in the Calamus and DTP world.

News Desk will contain the most relavent and up to date information on product announcements within the DTP world to keep you abreast of this fast moving market.
Each issue has an indepth reveiw on a forthcoming, new or existing product that will enhance the use of Calamus. Many reviews will be written by experienced users who rely on the best products for there livelihood. Technical tips will tell you what the manuals don't. This willbe done by experienced users and you will learn all there is to know about Calamus DTP.

The CALAMUS USER is available now four times (quarterly) a year for the introductory price of $22.00 (US Dollars) postage paid to your address.

This "Fanzine" will only survive if you the user contribute to it's content. So, please help us to achieve our goal by subscribing to it.

For more information about this magazine, or if you want a years subscription please send checks (US currency only) made payable to:

D. Trutzenbach
31 Muskingum Drive,

Shamong, NJ 08088.

or call the Round Table BBS at (609)268-7524, your Calamus, Desktop Publishing support BBS.

Rocky the Flying Squirrel voice: _again??_ Apple's been "going under,"
according to people like Mr. Trauth, for fifteen years.

> I found this in c.o.o.a. It has some very enlightening info about Apple that

From the context, I take this to mean comp.os.os2.advocacy, though nothing
with a related subject has hit my news server in the last 400 messages. I
don't need to comment on the suppression of clues on author, subject,
context, or even clear ID of the newsgroup -- I see at least three groups
that match "c.o.o.a." The big point is: What sort of idiot believes a
USENET posting proves anything? Paid your modem tax lately?

> I think one Peter Sinflop-Day should know.

Very nice. Parody of opponents' names is the sure sign of a forensic genius.

> ->System 7.x runs very slow on the PPC in emulation.

Nobody agrees with this. I begin to see why Mr. Trauth won't put his own
name behind his "facts."

> ->Apple doesn't even have
> ->plans to port it and says it cannot afford to do so.

Of _course_ Apple doesn't have plans to rebuild System 7 for PPC -- it's
working on a native System 8. McDonnell-Douglas has no plans to put jet
engines on the DC-3, either.

> ->To avoid two PPC
> ->standards a new Post-prep standard has been worked out. But Apple cannot
> ->afford to adapt its OS to the Post-PreP standard. IBM will help.
>
> So Apple is having cash problems! No wonder they are always having fire
sales!

Yeah. Nothing _else_ could explain a price reduction in the personal
computer industry.

What I gather from NPR and the Wall Street Journal is that Apple already
has a saleable OS for the PPC; IBM does not, and is covering the gap by
insisting that Apple develop a new kernel from scratch to use IBM's
not-yet-ready OS environment. Apple is already going full force on a

System 8 that _works_. Why should it want to hire an additional R&D department to write to an environment that does not exist and may not be fully defined? If Apple regards IBM as a potential paying customer for such an effort, that's hardly a sign of weakness, is it?

> ->BYTE magazine benchmarks last April showed that emulation shows some programs
> ->to only 1.6% of the speed they would have if they ran native.

"Some" programs. Which ones? If they had names, they'd be a byword by now, wouldn't they? Word 6 became famous as a Marvel of Soviet Engineering for less. Two possibilities: 1) somebody at BYTE concocted a nightmare 68K-only program to hit the (then extremely pre-release) emulator in all the wrong ways. I'll get to 2) in a couple of paragraphs.

> -> If any of Apples
> ->OS has to be emulated, it will become a bottleneck that slows performance.

Any of the OS? So if the only routine that's emulated were, say, OpenTCPDriver (making one up), then every word processor and spreadsheet would grind to a halt? Obviously not: some parts of the OS are more performance-critical than others. Those parts got translated to native code. Other parts are harder to debug than others, and reliability may be a factor in deciding not to translate them; and any code that doesn't get translated _still_ gets out the door and into the hands of customers. An advantage the OS/2 engineers, alas, do not have.

> SLOWED DOWN OVER 98% UNDER EMULATION!! PowerFlops must be great!! I bet they
> would run MacPaint slower than the original Mac. Or WordStar slower than the
> original IBM PC (assuming there was a Mac version of WordStar, that is).

Open Admissions at work in Mr. Magoo's alma mater. Let's do a little reading-and-math remediation, shall we? (That means "make-up work.") "1.6% of the speed they would have if they ran native." What does that mean? You say it means 1.6% of the speed they would have on a 68K. Thanks for playing. Rutgers: the High School _after_ High School!

2) [as promised above] In fact one program does run much slower on a PPC than on a high-end 68030: Excel, from Micro-what-do-you-mean-we-don't-own-the-operating-system-soft. Their floating-point routines had two options: run on the bare metal of a math coprocessor, or use Our Superior Routines. On the PPC, this means that they do floating point calculations several levels deep in the emulator. If they had soiled their hands with the IEEE OS routines, Excel would be acceptably fast on the PPC.

> ->The PPC chip is slower than the Pentium in interger processing, which is what
> ->counts.

Thomas Trauth will soon be appearing in Intel ads: "When I do 3D rendering, CAD, engineering, image processing, or even spreadsheets, nothing but interger processing will do. Pentium does not go overboard

with those confusing fractions and decimals."

> ->Furthermore, Intel's P7 chip will be full RISC and a match for the PPC.
> ->Windows NT and the MS apps can be easily recompiled to run native on the P7.

Note the concession that the "match for the PPC" has not yet arrived. Mr. Trauth sings the Intel user's song: "The sun'll come out... Tomorrow!" DOSheads are _always_ just one more chip generation, and "one more compile" away from catching up. And yet their whole code base still runs on CGA 386es. Amazing. I remember InfoWorld in January '83: "Apple Announces Lisa, Integrated Windowing Computer" along with the antidote story it always runs whenever good things happen to Apple: "Microsoft Promises Windows, Matching Lisa on 8088, by 4Q83." They claim they may catch up by 3Q95. "Tomorrow! Tomorrow! I love you, Tomorrow! You're always a day away!!!"

> If any of the above is true, than the PC clones will soon kick the PowerFlop off
> the planet!

"PowerFlop?" Sheer poetry, the way Mr. Trauth writes. Intellect oozes from every syllable.

> ->Apple and the PPC are IN TROUBLE. What user is going to run in emulation when
> ->MS and MS apps run native on equally fast Intel chips?

And when will that be? According to Mr. Trauth, not yet, and not soon. Even if Win95 is universally adopted, most software will still be running in 16-bit bitty-box emulators. So, to answer the question: Users of MS and MS apps will be running in emulation, and liking it. By their own showing they are very easily satisfied.

> I smell a new C= in the making. :-)

Nothing to smile about. First, nothing Mr. Trauth has said, or fobbed off on his nameless informant, is true. Second, without Apple to "catch up" to, who will do basic research for Microsoft?

> ->IBM will probably help Apple convert its OS to something that will run on the
> ->Post-PreP standard. That way a unified PPC standard will have a chance of
> ->competing with Intel.
> First Apple needs IBM's help to get a microprocessor that meets PC standards, and
> NOW they need IBM's help to port THEIR OWN operating system.

Helping the world's largest chip maker -- and Intel's biggest customer -- design a replacement for that customer's Intel chips does not sound like weakness, relative to Intel. The correction to the second part appears above.

> Makes me wonder...

Does it hurt?

> So, Peter, when do you think that bankruptcy hearing will be scheduled?

> * Tom Trauth
> * trauth@paul.rutgers.edu
> * Real computers aren't named after fruits and vegetables!

Real Rutgers students can win debates with vegetables.

> >> Mark <<

Disjointed?? What do you mean? More expensive? Perhaps.. the canadian dollar is running in the mid 70 cents range when compared to the american dollar though, so it probably equates to something similar.

Umm, if I didn't know better, I'd swear that your reply places Canada in the UK????? Ummm.. I hope you're not serious.. unless we are talking commonwealth or something like that.

Dave

If I were to run a business, I'd slash my inventory whenever it makes sense;
I'd cut cost before getting into trouble; I'd avoid unnecessary expense when
everyone in Wall Street is celebrating my profit.
However, porting OS to completely PPC native is very important, isn't that
called System 8, which is being worked out and due by the end of next year?
I'm not 1000% sure of what I'm saying. I wish I hadn't embarrassed myself.

Wow, let's celebrate! Those nut heads' computers are running at 1.6% of the
could-be speed and they are happy!

Again I could be wrong, is there something called Very Long Instruction Set
Computing? Of course Intel is working on a full RISC chip that is 100%
compatible with the hopeful 80x86 structure, it's Q6. Why would anyone
think they'd waste time turning out anything less than RISC after Pentium?
Of course, RISC is only cool in FPU benchmark. And since Window95 shipped
right on schedule, porting Window NT is just like this, snap.

Let me have a not-so-intelligent guess, you either own a majority of
Microsoft and Intel stocks, or your relationship with somebody in Apple is
analogous to that of Biff & Michael J Fox in Back to the Future I,II and III.

I really doubt my ability to read newspaper now, but I thought I read:
Apple will port the Mac OS, IBM OS/2 for the PowerPC and AIX, and Motorola
Windows NT. Specs will be published in the first half '95 with prototypes
later in the year. Machines are expected to be available in 1996.

There was no mention of IBM taking an equity stake in Apple.

As stated, IBM will be selling PowerMac clones based on the new PCI Macs next
spring. The recently agreed Prep Standard will not bare fruit until'96'.(Des
Moines Register 11/8).

BZZZT. Wrong again. Not having a good track record this week. Read carefuly..

Agreement Reached on Hardware Reference Platform for
PowerPC Microprocessor

Open platform to create broad array of computers that run multiple
operating systems.

NEW YORK, New York--November 7, 1994--Apple Computer, Inc., IBM
Corporation and Motorola Inc. today agreed on a new hardware
reference platform for the PowerPC* microprocessor that aims to
deliver a much wider range of operating system and application
choices for computer customers.
The new platform defines an architecture--a framework made up
of open technical concepts, definitions, specifications and
interfaces--that can be used by any hardware or software vendor
to build compatible PowerPC-based computer products that are ready
to run a tremendous variety of applications written for a number of
industry operating systems.
The new hardware reference platform for the PowerPC microprocessor
is expected to support popular operating systems, such as the Mac** OS,
OS/2* for the PowerPC, AIX*, and Microsoft Windows NT***. (Editors'
note: Novell, Inc. today also announced its plans to provide
related Novell release entitled, "Novell, Inc. to Support New Apple,
IBM, and Motorola Hardware Reference Plaform for the PowerPC
Microprocessor.") Many of these operating systems already support
current PC applications through software emulation or hardware
extensions.
To ensure that the vast majority of applications written to
current specifications will run largely unmodified on the new hardware
reference platform, the platform will combine many technical

characteristics and features from Apple's Power Macintosh**
architecture and from the current IBM and Motorola PowerPC Reference
Platform, adopted by a number of hardware and software vendors.
Each company intends to take technical and financial responsibility
to port an operating system to the common platform. Apple** will be
responsible for porting the Mac OS, IBM for OS/2 for the PowerPC and
AIX, and Motorola for Windows NT. The three companies will continue
to work together with other vendors on porting their operating
systems to the new platform.
In a joint statement, the three companies said, "The PowerPC
microprocessor has already established itself as the industry's
price/performance and technology leader. By combining that
technology with an open hardware platform and the industry's broadest
industry standard--one whose entrance means greater value and
performance for customers, greater opportunities for developers and
greater competition for the industry."
The hardware reference platform aims to create new business
opportunities and alternatives for software developers and hardware
vendors who demand a higher return on their investment. This new
platform will allow vendors to invest once in developing a product
and have it reach a huge installed base of computers from a variety
of vendors.
The objective is to achieve 100 percent compatibility with current
PowerPC-based hardware and software application products, while
creating a new base standard that offers advanced function future
capability. These features include designs for high-performance
peripheral component interconnect (PCI) bus, system boot or start-up
that works independently of the operating systems, and industry
standard components and I/O systems for compatibility.
More technical information on the new hardware platform will be
published in the Spring of 1995. The alliance members plan to present
prototypes of the systems based on the specification in 1995, and the
first computers are expected to be available in 1996.
PowerPC is a family of RISC-based microprocessors developed
technology alliance between the three companies. Since then, the
companies have garnered broad industry support for the PowerPC.
Currently, over 25 companies are developing or marketing PowerPC
systems, including Apple, Bull Systems, Canon, FirePower Systems,
Hitachi, IBM, Motorola, PowerComputing, 3DO, the Taiwan New PC
Consortium and Toshiba.

As a platform for running PC the powerflop isn't too hot. Maybe its
because its already burning power on running a 68k emulation for the OS
and mac apps. You also need about 16 megs to run the emu and it doesn't
do 386 enhanced mode, so IBM had better have a trick or two up its sleve
if it wants its PPC PC compatibles to sell in a market with fast Pentiums
becoming increasingly cheaper.

>
Oh I am sorry, I am sitting in front of sys7.5 on a Quadra650.
Screen updates don't always happen. Example if I log onto another
machine at start up, it will but the box up on the screen that has
the bar to tell you how far along in the loading process you are. After
you enter a password when asked for it, the box will disappear, only the
bar will remain on the screen. There seems to be a problem with SuperClock
and MSWord5 (Everynow and then in MSWord you can no longer see the File
Menu, and the page number indicator goes up about a page a second). There
are really aren't many new features in 7.5 that couldn't have been added
through shareware software. The one good thing about 7.5 that won't affect
about 99% of all Mac users is that the finder is scriptable. I really
like this, but like I said it won't matter to most. Anyway, I think I
defended mine well, care to say how it is more stable and faster now.
I can go on with my complaints, but they would drift away from being
7.5 specific. Like how come pulling a menu down causes the Mac to do
nothing else. I mean you can lose a connection to another machine just
by holding a menu open for too long, and causing a timeout.

Later,
Rob Morton

! >it's because it's running a halfway-decent OS ?
!
! I don't know what you are doing, but on the previous Computer Chronicles
! episode showed a Powermac 7100 blowing away Compaq Pent. machine away.

I think you've missed the point Peter. The IBM 25T is the standard IBM PowerPC workstation. Standard in this case = base model (more or less, we have some extra emmory in there.)

Just doing things like drawing windows, disk access, WWW browsers (ie: net access) - the Mac is s l o w.

Our offices have some pretty impressive stuff - SGI Onyx's, Indigo2's, HP apollos, DEC alpha's and a sun sparc (the printer-server :-). Of all the machines (which are set up to be more or less homogeneous), no-one uses the Mac apart from to layout some complex DTP that TeX is difficult to use for (eg: putting figures surrounded by text, is this *possible* in TeX ???).

I suppose in that limited sense we get use out of it. Personally I loathe the thing. Seems to take forever to get up and running. And you can't interface it to anything. Our machines have adopted the Europarc ideas - we all have id badges, and when you get up from your workstation it closes down after a few minutes, so someone else can use it. As soon as you sit down in front of another, it fires you up exactly as you were when it shut down. Even the text documents are *exactly* the same - the cursor is in the same place :-)) I don't expect the Mac to be able to do this (it's a unix thing :-) but this can be done because firing up a session takes oooh 4 seconds. Doing the same on the Mac takes about 30 secs. No-one uses it.

Simon.

The startup progress bar is the only time I have seen that happen. It
really has no affect on how the machine works. If you hate it so much
just use a startup pict/

>and MSWord5 (Everynow and then in MSWord you can no longer see the File
>Menu, and the page number indicator goes up about a page a second). There

Don't use MS-Word. MS-Word is the buggiest piece of software available
for the Mac. It is always incompatible with new Apple releases.

Drag Manager, Quickdraw GX, MacTCP, Mac Easy Open, Thread Manager,
PowerTalk, PC Access, The Find File program, etc. Most of these have no
shareware equivalent.

>7.5 specific. Like how come pulling a menu down causes the Mac to do

That's strange, my mod player, terminal program, ftp program, chug right
along when I hold down a menu.

: Disjointed?? What do you mean? More expensive? Perhaps.. the canadian dollar
: is running in the mid 70 cents range when compared to the american dollar
: though, so it probably equates to something similar.

: Umm, if I didn't know better, I'd swear that your reply places Canada in the
: UK????? Ummm.. I hope you're not serious.. unless we are talking commonwealth
: or something like that.

I generally assume that most people are intelligent enough to
realize that Canada is not part of the UK or the US either. The dollar
could be one factor, but the fact that a $249 (US) Jaguar sells for $350
Canadian dollars is stretching it. In comparing US vs. Canadian prices on
many goods, one rarely sees that much of a discrepency. The retailers
around here like to blame things on Beamscope (the Canadian distributor).

Now to get back to the original header in terms of speed which is
faster (now dont bother quoting MHZ etc numbers to me) an Amiga 1200
or an F030.

Could someone see how long it takes to unzip a 500k file using a
graphical shell on both machines while running say emacs and
bash as well and time it?

All things being equal such as :
Using internal IDE
Same RAM (4mb)
Falcon (running MiNT)
Same number of colours.

Just to that the test is fair.

|> Where did you get this information? System 7.5 is actually faster and
|> more stable than previous systems (I'm running a prerelease version
|> from March, and it's both faster and more stable than the release
|> version of 7.1 Pro).

In my experience, System 7.5 has made a tradeoff between functionality and resource requirements. Since upgrading from System 7.1, the space requirements have increased to 3Mbytes of memory for the system software and the boot time has increased by a factor of 2.5. New functionality comes with 7.5 but some of it has less than sterling usefulness. At least Apple had the sense of humor to implement MacPostits.(as originally seen on Saturday Night Live) Applescript finally comes in 7.5. PC Exchange, which allows import of files from PC disks, appears in 7.5 but to my knowledge does not allow the writing of files to the PC floppy.(IMO, that makes PC Exchange virtually useless). The latest Quicktime appears as well as a number of cosmetic features. In my experience, once you get into applications you do not see much degradation in performance. OTOH, I don't notice the increase in performance indicated by the previous poster. This makes sense because no ROM toolkit upgrade took place. The Amiga OS upgrade from 2.1 to 3.1 really does not compare to the 7.1 to 7.5 upgrade because the Amiga upgrade adds more fundamental changes, IMO.

Integer is only important if you dont have an fpu. macs didnt for a long time and neither did ibms. Now that fpus are gonna be a part of our lives for some time youll see integer calculations rerouted to the fpu if not rewritten for the fpu (on both sides). Also think of how shaky parts of our transition have been. Do you really think youll get through easier?

with less standardization? full x86 compatability is wishful by itself but
s smooth transition puts you guys in never-never land. Easily recompiling
isnt going to be that easy after all anyway but thats a different story.

> Again I could be wrong, is there something called Very Long Instruction Set

Well perhaps he takes about 2 years to snap (like chairman bill)

> >First Apple needs IBM's help to get a microprocessor that meets PC
standards, > >and
> >NOW they need IBM's help to port THEIR OWN operating system. Makes me
> >wonder...

Whoops! I almost forgot. Guess whos porting NT over to the PPC? well its
not microsoft but motorola. Guess they need somebodys help to port THEIR
OWN operating system. Makes me wonder...

Whats with all the atari and amiga people anyway? youd think they even
HAVE a future (Besides atari game machines and the perpetual scrounging
for working spares for amigas-like something out of road warrior)

I wonder, do you folks have nothing better to do than to argue
ad infinitum (ad nauseum as well) about which dead machine is better?
It is sad, but both Atari compters and Amiga computers are dead. They are
still good, they work, and in many aspects they're better thatn whatever
else is available there. Still, they're dead....

Gee, that's really funny. Since the day we installed 7.5 over
whatever piece of garbage PowerTrash ships with, we had _more_
crashes, _more_ incompatible programs (try using Radius Pivot
with 7.5...) and _less_ free RAM. All that with no increase in speed.
Apple may have some half-decent ideas. They don't have decent
programmers to implement them.

I do check out pretty much all Amiga magazines, thanks. Other video
enchancements have gone up in price but their functionality has been greatly
increased. Take for example, ImageF/X 2.0.

There's a lot other software that remains at the same price. And BTW,
since you 'look for the Mac best prices' why don't you do the same
for Amiga prices when comparing to be fair? I think I read you could get
Imagine for much less than that...

Ah, just in case and hot off the press (Nov. 7). Motorola/Apple/IBM made
a joint announcement that they finally adopted a standard PowerPC architecture.
The machine will be the 'standard' for which clones will be made (so, NOPE,
IBM WON'T MANUFACTURE Apple PowerMac clones in particular, like you said).
The machine will run Windows NT, OS/2, AIX, System 7.xx (8?), etc. and is the
companies responsabilities to port those OS. IBM has to do OS/2 and AIX,
Apple has to port System 7.xx and Motorola Windows NT.

The machine will be able to run all of them, whatever the user wants.
Let's see how system 7.xx will be able to survive :-)

```
TOAD COMPUTERS -- HOLIDAY FESTIVAL '94
======================================================================

NEW EXHIBITORS JUST ANNOUNCED: GRIBNIF AND ANODYNE SOFTWARE!

Toad Computers is proud to announce HOLIDAY FESTIVAL '94 which will
take place on December 3rd & 4th, 1994. Last year's event drew
500 people from all over the country and featured guests and
exhibitors such as:

- Dave Small
- Joe Waters, Ed. of Current Notes
- Charles Smeton (STraight FAX!)
- Dave Troy (CN Columnist / Toad Co-owner)
- Tim Reyes
- MajicSoft
- Carter's Creative Computer
- Greg Ondo of Steinberg Jones

We'll feature free hot apple cider, door prizes and more! We'll also
have another raffle to benefit Habitat for Humanity (which raised over
$500 last year!!)

The show will take place at TOAD COMPUTERS in the Park Plaza Shopping
Center in Severna Park, Maryland. There's unlimited free parking and
lots to see and do nearby, as we're nestled between Washington,
Baltimore, and Annapolis.

Confirmed 1994 attendees include:

- Tom Harker, ICD Inc. (CatBox and Star Battle)
- Roger Burrows, Anodyne Software (ExtenDOS CD Driver)
- Gribnif Software -- Dan Wilga / Rick Flashman
- Bob Luneski, Oregon Research
- MajicSoft
- Binary Sounds (Hybrid Arts Product Line)
- Joe Waters, Ed. of Current Notes
- Greg Ondo, Steinberg Jones
- Charles Smeton (STraight FAX!)
- And of course, the Toad Gang -- including
Dave and Jennifer Troy

TOAD COMPUTERS HOLIDAY FESTIVAL '94:

Saturday December 3rd 10:00am - 7:00pm
Sunday December 4th 10:00am - 5:00pm
```

The local HOLIDAY INN is offering $59 (reg $90) rooms for the
show. For more information, please call us at (410) 544-6943!

Keep an eye open for further developments on the show! We plan to have
announcements on and in:

- GEnie - CompuServe
- Internet - Delphi
- Current Notes - ST Informer

We will also be mailing postcards in support of the show
sometime in November. If you know of someone who would like
to come to the show, give us their name and address and
we'll be sure they get the information!

ADMISSION IS FREE!!!! ADMISSION IS FREE!!!

We hope to see you here! Last year, we were really happy with how
things went. The holiday season adds a spirit of real levity and
excitement that is often missing at other Atari events. We're looking
forward to putting on a first-class show, and we hope you can join
us.

> Sorry, where does that leave product for ST owners then? I was under
> the impression that they used DD disks?

You've missed the point that Falcon software uses the features of the Falcon that aren't contained in an ST. As far as I know 100% of Falcon software comes on HD disks. It's no good saying that ST users with single-sided floppies can't access it because I don't think C64 users can load anything on A1200/Amiga disks either. You were talking about the Falcon and not any prior versions.

> > :>If Atari went under, I wonder would anyone bother to try to get
> > :>the rights to make Falcons?
>
> > The Falcon hardware is already licensed by Atari, so your wrong on
> > every point (again) Gavan..
>
> Wow! Who are making all these falcon clones then? I don't see any
> ANYWHERE.

The first machine is a TT clone - 68040 at 64MHz, 8-128Mb Ram (supports up to 4Gb), HD floppy (can be upgraded to 2.88Mb), built in IDE interface, support for optional SCSI, 6 expansion slots. Under development are 32bit Graphic card support, '060 adaptor card and DSP board. Available in Germany for a few months already, now in stock in London.

Err... you were saying?

#pragma flame_resistant_suit on
I know this is the Amiga group, but let's stick to facts, hm?
#pragma flame_resistant_suit off

PC Exchange does support both writing to and formatting PC disks. (Go
on, try it, it's an option in the new erase disk dialog.)

>The latest Quicktime appears as well as a number of cosmetic features. In my
>experience, once you get into applications you do not see much degradation in
^^^^
Does this word correspond to "any" in your vocabulary? If not,
something's wrong, because there shouldn't be a performance decrease.
The only reason that there is a "performance decrease" at startup is
because of all the new System Extensions such as AppleScript, PC
Exchange and AppleGuide (which is more than a cosmetic feature, BTW).
Simply use the new Extensions Manager to turn off all the extensions,
and your startup time will shrink back to pre-7.5 levels.

>7.1 to 7.5 upgrade because the Amiga upgrade adds more fundamental changes,

I think you're trying to apply Amiga concepts to Macintosh. The System Software is perfectly capable of getting faster (mostly by rewriting a lot of heavily hacked code originally written in 1984) without a hardware upgrade. Some people don't seem to notice a major increase in speed.. it appears to depend on the CPU. I know nothing about Amiga 2.1 - 3.1, but System 7.5 is *not* intended to be a major upgrade. The major upgrade ("Copland," System 8) will arrive in early summer '95.

Er, no. All the A1200 SCSI options are the same as that in the Falcon
AFAIK ie SCSI I connectors and data xfer rates, but SCSI-II command set.

The Warp Engine offers FAST SCSI-II on the A4000 and I think so do the
GVP and Cyberstorm boards..

The main performance improvement seems to be in the improved disk cache. Some of the new features, OTOH, look somewhat sluggish (in particular AppleGuide on slower machines).

> This makes sense because no ROM toolkit upgrade took
> place.

Doesn't matter. Apple gradually patches out much of the ROM in new System releases (For example, a Mac Plus, which was originally designed for System 3.2, can support systems up to 7.0.1, possibly even further. It acquired fancy error sounds, AppleEvents, and all that along the way). As an example more closely related to PowerMac performance, the initial release of Color QuickDraw for the Mac II was somewhat slow, so it was patched a few months later.

Sorry you couldn't understand that simple English sentence, I meant most programs give you 8 bit sound as an option. There is a subtle difference between what I wrote and what you said I wrote. I admit I could have done with an 'aswell' after 'uses 8 bit'.

>
> >BTW don't cry Gavan just because .MODs originated from the Amiga, S3M

> >Amiga module format???
>
> Actually the aged GMC format can handle as many tracks as you want with
> only a minor modification. It uses a similar format to MTM...

But is it really supported? Let's face it, at the moment it isn't really feasible for A1200 owners to use more than 4 channels it most situations. It's the same as on the STe, 4 channel tracker stuff was the exception rather than the norm. I admit that at the moment there's a lot of 4 channel stuff on the Falcon, but it's far more cable of extending that to 8 with very little extra overhead. The soundtrack on the Knockout is 8 channel and very cool, almost like Orbital. One thing in the A1200's favour is t
hat 4 channel tunes will take less processor time on the A1200 then the Falcon, but put up the number of channels and the Falcon wins hand down.

Look, I'm not being hard on the A1200, the GUI seems really fast, but I went round my mates house and he played a 12 channel S3M module and I'm afraid it just didn't cut it at 16KHZ. The Falcon plays 32 CHANNELS AT 50 KHZ. I don't know how much processor time this uses but the fact that it can do it at all says something about how fast the DSP is when it's mixing 4 lots of 8 channels.

I just can't understand why Amiga owners have to feel that they ALWAYS win about EVERY aspect of their computer's hardware. I've admitted that the A1200 GUI is fast compared to the Falcons, why can't you admit that the Falcons sound system is far superior to the A1200's without saying, 'Ah , but we don't need 8 channels, we don't need 16 bit sound' etc. etc. BTW my friends A1200 has 2 megs of chip RAM and 4 megs of FAST, so I suppose this helps the speed somewhat.

Alan.

Silicon Graphics have brilliant graphics and rendering capabilities built
in, so why not buy one of them? 'Cos they cost more? Exactly.
It all depends whether you consider that the Falcons built in features work
out cheaper than buying the equivelant add-ons for the Amiga, but what
use are they if you don't use them?

: Duh! You have the same genlocking capability that the A1000 had from
: day one. Stick to audio, you obviously have no idea about video as thats
: the Amigas field.

Yup, what the Falcon has are "genlockable screen modes", a la Amiga. Except
like you said, the Amiga had them from day one. Mind you, I'm not about to
start arguing over each machines relative merits, but regardless of how
good the Falcon is/isn't it has a major problem, which is, no software. These
days, you can't just write your own..
When it comes down to it, Atari are so useless they may as well be dead (as
opposed to C= who really are effectively dead! :( )

: Your mate has a single floppy A1200 doesn't he. Splitting files across

No he has an 80meg hard drive (same house, different mate) the other one
has the single floppy. This one has three floppies and an HD.

: multiple MSDOS disks and recombining them on such a system is indeed labourious.
: I should know, I used to do it when internetting files down to my Amiga
: via PC disks. Of course, when you get a hard drive it becomes a LOT easier.
: Plus of course, many FTP sites for the Amiga will use the in-built splitting
: of DMS to produce two <720K file chunks. Of course, the best way is to use
: SPLTIZ and JOINZ as you get versions for Amiga, PC and Mac.

That's still hell of a labourious process than Falcon owners don't need
to undertake.

: But youre right, One of the reasons I'm going to make my second drive
: a HD drive is because I want easier xfer between PC and Amiga. In fact, its
: the only reason. I need a second drive anyway and since HD drives are 60 quid
: as opposed to 50 quid for a DD drive I figure I might as well make it HD
: and make my life easier wrt to PC file xfers.

: Your friend might find things a lot easier if he just spends the 50 or 60
: quid to get an external drive for his A1200 (either DD or HD).

See above.

: > At least we don't get that problem. HD's are better than DSDD's, they
: > hold more, they cost same price give or take a fiver. Now, try doing the

: > : For best value, get your PD on CD. Theres stacks of Amiga PDCD
: > : roms out there now,

: > Oh god - yes, yes, lets all rush out and buy a CD-Rom.... yet MORE
: > expensive for your all-singing-all-dancing Amiga.

: You do the math. A CD drive with a PD CD works out a LOT cheaper than
: buying the equivalent PC on floppy disk. Of course, on the Amiga you get
: a good choice of CD ROM product, this might be less true on the Falcon
: so maybe a CDROM drive wouldn't be as good a bet.

I was refering to 'do the math' about the HD's. Please don't switch my
posts around like that. But a CD-Rom (esp. for an A1200) is a lot more
money to spend.

: > : Well, I meant software titles in general, not dedicated mod players
: > : (which originate from the Amiga incidentally). Where are all the multimedia
: > : and games titles that use lots of 16 bit sound?

: > They are NOT players - read the post - they are EDITORS. Geez.

: So where are the multimedia and game titles then? Whats the choice like
: in multi-track direct to hard disk digital editing software too? I'd
: imagine there should be quite a choice by now.

You'd imagine right then. Don't try biting back with all this multimedia
bull, just accept my original post that we have the capability to do top
level soundtracker editing/composition that the Amiga cannot hope to match.

: Oh, and wheres that DSP software modem that falcon owners have been
: mooting since day one?

Anyone will tell you that DSP modems don't work out on a power/price
ratio and now you can purcahse 14,400 and faster for easily a hundred notes
these days there is little need for them anyway. Please show me where
any decent DSP modem exists - for any platform.

: > on 7 HD disks.... that would mean 14 DD disks ;-). The 50% estimate you came
: > up with just shows how pathetic you really are, you never change Gavan!

: Sorry, where does that leave product for ST owners then? I was under the
: impression that they used DD disks? Some even use single sided DD disks (a
: friend has an old STFM with such a config). So I'd say that saying 50% of
: Atari computer product coming on HD disks is _over_ optimistic if anything.

For god's sake please READ CAREFULLY Gavan. He said 99% of FALCON
software came on HD disks. Why are you harking on about STFM owners?
That's so irrelevent its a joke. Putting Atari ST software on HD disks
is about as sensible as putting Amiga software on HD disks, ie - not at all.

: Not for general purpose word processing, compilers, databases, spreadsheets
: and games it doesn't.

Word processing it kicks butt. Papyrus Gold, Speedo GDOS fonts. etc...
Compilers - GNU C, HiSoft C, C++, Gulam, Devpac 3, HiSoft Basic 2.10,
Cobol, Pascal, Fortran - the list goes on. They are AS advanced and
quite as capable as any Amiga product. The only area we are lacking is
that you have Blitz Basic/AMOS Pro - but then that's games after all.

: For digital signal processing, it does. Possibly something to do with
: the DSP.

DSP doesn't mean JUST music. DSP GIF displayers, DSP JPEG decompression,
DSP MPEG players.... get the picture?

: > Gavan thinks 16bit stereo sound is 'nice', it is *essential* for a modern
: > multi-media machine.

No, he would think it was *essential* but only if the Amiga was capable
of it, which it isn't, hence its only 'nice'.

: You want 16 bit stereo sound, then add a CD rom drive as you'll need
: it to store all that data. Whoops! But then you can just play the audio
: straight from CD as the CD32 does (or any Amiga with CD ROM, or any
: PC with CD ROM).

I'd love to see a CD32 record D2D and then playback from its CD player.
Tell me, do you use the joypad to alter the frequency? ;-)

: Of course, to plug a SCSI in you have to buy one of the many SCSI
: interface cards but I'd rather pay for my SCSI when I need it, than pay

: for it when I buy the machine regardless of if I need it or not.

Judging by todays HD prices, having SCSI already there would be rather
useful. It certainly isn't looked upon as a luxuary in the PC world, so
why should the Falcon world be any different?

: Wow! Who are making all these falcon clones then? I don't see any ANYWHERE.

Who needs clones when the parent company is still perfectly capable of
making them themselves? Or did that slip your mind? Perhaps we ought to
run off to the Bahama's (or wherever CBM hid from their creditors), enter
liquidation then wait for the flood of interested parties to get in touch.
Hmmmm reality sucks doesn't it.

: a lot more development put into it than the Falcon ever had. What other
: company would release a machine and then do NOTHING to develop it, dropping
: all work on it to concentrate on a GAMES CONSOLE?????

CD32 springs to mind.... but then they didn't drop Amiga development.
They died all together. CBM R.I.H (Rest In Hell)

There is no phoenix for the CBM fire.

: If Atari ever do make another home computer, you can bet it won't havbe
: anything to do with the Falcon.

Now that I _will_ agree with.

: gavan

> That's so irrelevent its a joke. Putting Atari ST software on HD disks
> is about as sensible as putting Amiga software on HD disks, ie - not at all.

Yeah, but he was referring to my 50% estimate for Atari software (which has`
been cut out of the quote somewhere along the line).

Since the vast majority of Ataris out there are ST - derivatives, they are
very relevant. Many companies still developing Atari computer software will
want to make sure it can run on the ST. Therefore they _have_ to ship software
on DD disks if it is to be ST compatible.

Sure, getting AGA games on HD disks (in the increasingly rare cases where
they aren't HD installable) would be more convenient than having them on two
DD disks, but for computing use floppies are irrelevent anyway. It just means
less disks to distribute your software on. ie you can install off 5HDs instead
of 10DDs. Hardly the end of the world if you only have a DD drive.

Od course, for an unfortunate user with only a floppy based machine the
HD floppies will be a distinct advantage.

> : Not for general purpose word processing, compilers, databases, spreadsheets

> that you have Blitz Basic/AMOS Pro - but then that's games after all.

Again, my quote got chopped off somewhere. I believe I was referring
to the fact that the DSP in the Falcon didn't help at all for the majoirty
of general computing tasks. So saying because the Falcon has a DSP it will

kick butt in x, y and z just isn't true.

> : > Gavan thinks 16bit stereo sound is 'nice', it is *essential* for a modern

As I said in my original post, SOFTWARE is essential for a multimedia
machine. Wheres the Falcon SCALA or Mediapoint?

> : You want 16 bit stereo sound, then add a CD rom drive as you'll need

> : PC with CD ROM).

> I'd love to see a CD32 record D2D and then playback from its CD player.

CD32s don't NEED to record and playback sounds. They are mostly used
as consoles although they can be expanded to take HDs and Keyboards etc.

Software exists for the Amiga (as it does for the Falcon I assume) to
allow you to read the audio data off a compatible CD player via SCSI so
you can do 16 bit sampling that way. Playback is of course only 8 bit
at the moment. Makes more sense to read the data straight off CD than
to to a D->A through a wire and then A->D at the computer end.

> : Of course, to plug a SCSI in you have to buy one of the many SCSI
> : interface cards but I'd rather pay for my SCSI when I need it, than pay

> Judging by todays HD prices, having SCSI already there would be rather
> useful. It certainly isn't looked upon as a luxuary in the PC world, so
> why should the Falcon world be any different?

Very few PCs come with SCSI - they all use IDE. SCSI is looked on as a
'high-end' feature for fileservers.

Its very rare to see SCSI drives undercut IDE prices, but for large
(ie > 1/2 gig) drives SCSI is the solution to have.

> Hmmmm reality sucks doesn't it.

> : a lot more development put into it than the Falcon ever had. What other
> : company would release a machine and then do NOTHING to develop it, dropping
> : all work on it to concentrate on a GAMES CONSOLE?????

> CD32 springs to mind.... but then they didn't drop Amiga development.
> They died all together. CBM R.I.H (Rest In Hell)

No Amiga owners are sad to see the end of CBM. It's a pity they've hurt
the Amiga but we think of it as a boyle being lanced.

> There is no phoenix for the CBM fire.

Lets hope not. I want to see a new management.

You don't need to know something has SCSI, the OS will support any devices
you have put on the machine. And you can get a 28mHz , 6 meg , 80 meg HD A1200
for 640 quid. Thats a lot cheaper than any Falcon equivalent and the 28mhz
processor with fastRAM and proper 32 bit memory access is going to go
a _lot_ faster on apps than the 16mhz, 16 bit, shared access of the
Falcon.

> : Duh! You have the same genlocking capability that the A1000 had from

Ever heard of Babylon 5 or Robocop or Seaquest DSV? And as for video
titling the Amiga rules supreme in the amateur and semi pro markets.

Its not like the situation where recording studios are defecting to
the Mac from the ST - other machines just _can't_ do the things video-
wise that the Amiga can. The STs midi popularity came from the fact that
STs had the midi ports as standard, there was nothing 'better' about
them for midi use than any other computer.

How long have YOU been in this newsgroup? I skip long messages since I don't have all day to read the news (and it would take me several hours to read even though I use NN if I didn't skip lots of stuff), so I may have missed some of those postings. Nothing he could possibly say could excuse the names I've seen Mr. Trauthole calling him ever since he's been posting to this group (I think I've seen him doing it as long as 6 months ago, and it offended me at that time and it still offends me now).

Even though I don't agree with Mr. Trauth's opinions, he's more than welcome to express them, but I take exception to his name calling & general offensive tone.

It was in 1992 that people had their heads up their asses; that's why His
Slickness became President. However, people have since seen the light.
They realize how lousy Mr(s). Clinton(Rodham)'s agenda is and have sent
him(her) a popular mandate to come up with another one.

And he will have to come up with another one. He couldn't get most of his
old left-wing agenda past the Democratic Congress that just adjourned.
Therefore, how could he possibly get it past a REPUBLICAN Congress.

Looks like His Slickness will have to become what he accused Bush of being
when he campaigned for President - an "obstructionist" who vetoes everything.

if anyone is interested, there are a couple of new products comming out for the falcon within the
next upcomming months; well some of them are actually out already. There is a 04 board called the
the barracuda that will turn the falson into a true 32 bit computer
making it run 500% faster. It will also give you additional screen resolutions such as 1200-800.

A rack case is also available increasing the power of the machine so in combination
you can run cubase audio in 16 colors without any loss of speed and it will also let you use an
optional keyboard (PC keys if desired).

There is a video system that will allow you to do professional broad cast video 30fps with animation and
rendering software..... It supposed to rival the video toaster. I havent seen it yet but a friend of mine
who saw it at comp USA said it was *******beautiful.....unreal**********

I just hope these products will broaden the machines appeal. And, if all
goes well with the quality and the pricing I am sure it will...

also if anyone know a way to get any digiital arts stuff please e-mail me
I cant find it here. Also what is the lasted word on any emulations for the falcon
I am interested in pc-and mac cd-roms and I am not just talking about the
files :-)..... I know there is one comming out early 95' hahahahahhahahha
but that is a 486sx and i think it wont offer a sound driver even though It was mentioned
to me it was possible. I would like the dx because I like 3D studio.

If you guys know of any new GOOD music, DTP and video graphic software that is out or is
comming out please let me know... you can e-mail me at
wills@newschool.edu later.,

4640. ATARI gave up on computers last year...

Hi folks. I grabbed this from the Business Wire:

ATARI RESPONDS TO DAN DORFMAN ARTICLE IN USA TODAY

SUNNYVALE, Calif., Nov. 8 -- The following was released today by the
Atari Corporation:

Atari senior management today rebuffed Dan Dorfman's November 7th USA
Today story. Commenting on Dorfman's report Sam Tramiel, Atari
President, said, "It is disruptive to the market to have a short
position fund manager such as Mr. Sass put out a self serving report
with critical information omitted and not even bothering to call the
Company to confirm. It is further disturbing that Mr. Dorfman condones
such behavior and comments on such positions."

The article, with testimonial from Martin Sass of M.D. Sass Investors, was misleading and contained many inaccuracies such as:

1. Dorfman says that this is the second time that Sass shorted the stock and that the first time was in April of 1993. From what Atari understands the fact is that Sass did this in April of 1994 and that a report by Dorfman in June of 1994 quoting Sass saying that Atari was a bankruptcy candidate caused Atari stock to go down and benefitted Sass's position of being short the Atari stock to the detriment of Atari shareholders. In the months following the Dorfman report the Atari stock recovered in price and closed on November 4th at 6 3/4. Sass again is short. Atari and once more Dorfman issues a report quoting Mr. Sass and Mr. Sass benefits as the Atari stock goes down from 6 3/4 to 5 1/2 at closing on November 7, 1994.

2. Dorfman says that Atari officials were not available to comment. The fact is that Dorfman called the Atari office on Friday November 4th while a Board of Directors meeting was in progress.

3. Sass says that there is a shortage of software. The fact is that available software for the Jaguar is increasing with the delivery of five new titles by the end of November. These are, "Doom" from ID Software, "the best version of Doom on any platform" says John Romero of ID; "Checkered Flag" from Atari, a complete 3D world Formula racing game; "Club Drive" a 3D world game of driving simulation and chase; "Brutal Sports Football" from Telegames, a no holds barred game of football; and "Dragon: The Bruce Lee Story" from Virgin Software, an exciting fighting game based on the Universal Studio movie of the same name. Sam Tramiel says, "Software delays did occur as the development teams learned how to harness the power of the 64 bit Jaguar system. Now the developers are up to speed; we expect there to be a continuous stream of game releases throughout the balance of this year and into 1995 and the future."

The most recent release "Alien vs. Predator" (TM, Twentieth Century Fox) which hit the retail shelves in October, is selling briskly, is indicative of the technically advanced gaming experience which is possible on the Jaguar system. In order to achieve a high degree of game quality and the overall success of the Jaguar platform, management has intentionally delayed the publishing of some titles. Atari expects over 20 titles to be available by Christmas 1994.

4. Dorfman says that Sass sees a big write-off of the Jaguar system as well as write-offs in Atari's PC business. The facts are that Atari is
^^^^^^^^^^^^^^^^^^^^^^^^^^^^
out of the PC business and took write-offs in this area in 1993. There
^^^
are no more write-offs in the PC business for Atari. The Jaguar is the
^^^
leading technology in the interactive game market. Atari sees a very promising future for this platform, which includes the introduction in the near future of a CD peripheral and the possible entry into the interactive cable market.

Atari will soon be publishing its third quarter financial results and as expected will report a net loss of approximately $3.9 million as compared to a $17.6 million loss for the same period in 1993. The loss in the 1994 period was a result of delays in software releases as well as expenses related to promotional activity.

An important fact omitted from the Dorfman article was the recently announced agreements between Atari and Sega. Sega will license from Atari a patent library for a one time cash payment of $50 million (Atari's net being less contingent legal fees and costs). Sega will also purchase $40 million of Atari stock at a price of $8.50 per share, the same per share price paid by Time Warner in April of 1994. The agreement also allows for Atari and Sega to cross license up to 5 titles per year on their respective platforms. Finally, it also permits both companies to be publishers on each others platforms if they desire. These transactions are subject to regulatory approval and are expected to close shortly.

"The Jaguar represents Atari's philosophy of offering leading edge technology at affordable prices and we feel it has a very bright future," says Tramiel.

Atari Corporation (AMEX: ATC) markets interactive multimedia entertainment systems, including Jaguar, the world's only 64-bit system, and the only video game system manufactured in the United States. Atari is headquartered at 1196 Borregas Avenue, Sunnyvale, CA 94089.

My candidate got re-elected. And want to know why? 75% turned out.
Our Democratic electorate in the county swamped the polls. I can not say the
same nationwide. I should have no problem getting on Senator Tom Harkin's
campaign staff for the '96' election.

The reason the Republicans won, because of the heavy Republican turnout
nationwide. The Demoocratic electorate tends to be weak and unreliable voters
were as the Republican electorate are of more affluent see the reason to do so.
Only 35% of the registered voters bothered to come to the polls which
translates into 65 million people. The Democrats lost by one and half million
votes. So 34 million voted Republican. I hardly would say it was a mandate
for Republicans and their agenda. People voted for change and most of the
incumbents were democrats.

Once the Republicans show their true colors, than the electorate will have a
better understanding of the differences of the two party's. Now its the
Republicans who are in the hot seat. I see a fratured Republican party in the
next two years were moderates and the coservative groups including the
Christian Coalition try to exert their agenda. Can only benifet Clinton.

>
>And he will have to come up with another one. He couldn't get most of his

>Therefore, how could he possibly get it past a REPUBLICAN Congress.
>

What do you mean left wing agenda? You mean the budget, NAFATA, family leave,
increase student funding.

As for the Republican Congress, its upto to that party to submitt the bills and
pass it. Its one thing to pass a bill and another for the President to sign in
to law. Now its the Democrats turn in the Senate to fillibuster to all hearts

of content and the public will blame the do nothing Republican Congress.

>Looks like His Slickness will have to become what he accused Bush of being
>when he campaigned for President - an "obstructionist" who vetoes everything.

You mean Reagan's lapdog who was a puppet to the Christian Coalition.

Yep, I saw articles before of a similar nature, stating Atari had gotten
out of the home computer line. Maybe thats why they licensed the computer
to other companies.

BTW Is the license for just the ST/TT or is the Falcon included too.
Although the licensing means there may still be some Falcons, its not
going to mean that the Falcon will ever be any real competitor. A pity,
a lot of people who would move from the Amiga if it never gets made again
might have considered a Falcon if it had been sufficiently well supported.

Well just have to hope that C=UK, CEI or Escom get their act together fast.

I think that award will go to the Sony Playstation when it appears.

Does anyone know if the Saturn and PSX have made an appearance in Japan
as promised? I doubt they will, but then I doubted Atari would have the
Jaguar in production for last XMas.

Not strictly true, Rich, amigas are very popular machines for video
processing esp. where SGI machines can't be afforded. Take Babylon 5
for example - all special effects there are generated using amigas.

Admittedly they need a whole bank of them... :)

Raist,
Effectively Atari is out of the computer business, you are right.
But, they still do manufacture Falcons and TTs when demand warrants
it as far as I know. The TT is used in the Jag development system.
If the Falcon has been out of production how is that dealers have
them in stock and the price is not rising (and falling in the UK)?
When the TT was out of production it was nowhere to be seen. Do
you think that they produced that many more Falcons than TTs?
Atari, last I knew, was still sticking to the policy that Jag profits
would be funneled into the computer division. They may have changed.
Of course, Atari has liscenced the Falcon technology out so there
will be clones coming out (and some are out). Besides this I have
heard grumblings of 060 boards for the Atari line. The situation
is still better than that of the Amiga. Atari has also continued
showing a willingness to let others improve on their software.
They just gave the rights for LDW Power to Compo according to
ST Informer.
Also, Raist, are you really that happy if Atari no longer makes
computers? What does this prove? What was your point? Falcons
are still easy to find which is more than I can say for the 1200.

A PC is a Personal Computer. All current home computers are PCs.
Unfortunately, the tag PC has come to refer to just IBM-compatibles.

The statement could be taken as 'we've just gotten out of making clones'
but in the context I think it refered to 'computers' generally.

Its not as if Atari was ever a big clone builder. And I think they
stopped making clones LONG ago.

>>Try System 8..
>And when will that be out? 1996?

it is slated for middle to late 1995.

>And how much is Apple making relative to MS and Intel?

Actually last time I check Apple has more gross revenue then Microsoft
does in a year. Though they are very close. Intel is definitely larger
than both, but Motorola is a giant compared to Intel.

[boring dribble deleted...]

>>I suggest you get your head out of your ass and see one in use..

>I HAVE!! I have seen PowerMacs (I mean PowerFlops, sorry) in at CompUSA -
>and I was not impressed. And I making this follow-up on a Centris 610.

wow you have seen a computer in CompUSA. A new expert is born people.
I write software for windows, do system admin for unix, and you know
what I own at home. A macintosh. Why, because I can get work done.
I am glad unix is around, otherwise I would not make so much money a
year having just come out of college. As for windows? I still feel
it is a kludge. But Microsoft does know how to market, and that is why
there are so many windows users.

Back to the mac. I like the fact that in the past four years of owning
various macintosh's only once have I had severe problems that kept me busy
a day or two fixing them. That was just a couple weeks ago and most
of it was my own fault. I like the fact that I can bring a SCSI drive
home with me hook it up to my computer and copy stuff over. I like the
fact that a friend of mine whose mac had some operating system problems
could be networked over local-talk so I could back it up before I erased
the drive. I like macintoshs not because they are fast (though they are)
, or because I can add lot's off cool hardware (even though alot is built in)
I like them cuz I can do things quickly, easily and realibly.

An example, my answering machine went out a couple weeks ago. I had loaned
another one to a friend of mine, since the one that went out was not mine,
well I could not get it back for about two days, so I needed an answering
machine, did not really feel like buying one for two days. All I did
was turn on my mac, run Apple Phone, record a message and that was it. I
had an instant answering machine. And I could still do other work.
Granted it is not what it is meant for but it let's me get things done.

That is the whole point, if I am going to spend time making a machine work, then it is not working for me.

>>You mean that the current fastest clones cannot do so today? You just >>contradicted yourself.

>They can (in terms of performance). By "kick off the planet" I meant "reduce >Apple's market share to zero!"

Will never happen. Apple has had doomsayers since it started, for some reason apple keeps making money, and keeps introducing new and exciting technologies.

>>Who saids emulation. There are hundreds of native apps for the PowerMac..

>For instance?

go to bookstore. buy mac magazine. look at adds. see adds say now avaiable in powerpc native version. write down product. examine list when done.

>>Don't forget Motorola as well.. You wonder to much..

>What does Motorola have to do with Apple needing IBM's help to make a native >PPC version of Shits'em 7?

Apple is not making a full native version of System 7.x. It is pointless to re-invent the wheel. System 8 will be either fully native or almost, with only rarely used items not being native.

>Proof the Democratic Party is pathetic!

an argument not worth getting into.

The statement that was quoted was refering to clone write offs. Deal with it.
That does not mean that Atari is even making Atari computers anymore (they
claim to be doing so) but the statement was NOT refering to the TT/Falcon etc.

Richard,
Yes, I know that both Atari and Amiga made a big dent etc. FWIW, I have
a TT here that I use for DTP (Calamus SL, of course). I was just wondering
why people want to have _totally useless_ discussions, i.e. trying to prove
that Falcon's video or A1200's audio is better than the other's etc.
After all, neither is supported much. What difference?
Of course, it is fun reading this... I think I'll stay.

The CD32 is still in stock in the UK _and_ the price has fallen.
Does that mean C= are still pumping out CD32s.

Ever heard of warehouses and stock-building?

> will be clones coming out (and some are out). Besides this I have

Rubbish, there are many more Amigas NOW than there will ever be
Falcons, even if it kept selling like it is now for the next 5 years.
Theres more machines, MORE hardware, MORE software and most likely
better support (for the larger base of users) even if another Amiga
was never made.

> computers? What does this prove? What was your point? Falcons
> are still easy to find which is more than I can say for the 1200.

Falcons are (and always have been) very HARD to find. I've never
seen one for sale (in the flesh) ANYWHERE.

Sure, if you know who the Atari mail order dealers who stock them
are, you can get one. But how many people outside of the existing
(small) Atari userbase will ever even KNOW about the Falcon????

Up to the point of MacX you were doing pretty well. My Mac rarely crashes
(maybe once a day), and part of my job is to crash Macs. If we can crash
them so can our users. I have just started using MacX and it is very nice.
Impressed the UNIX guys that I work with. Handled most thing quite well
(Mosaic, Doom, Xeyes, and many others), but it also crashed the Mac
everytime we used it after a while. Guess I am doing something wrong, but
even if I am oh well. I mean if by doing something it causes a crash
then that is my fault?

[Article crossposted from comp.sys.atari.st.tech]
[Author was Rod McCall]
[Posted on 12 Nov 1994 18:20:07 GMT]

In the last two year here in the UK Apple Macs have become more apparent
on the high street. If Atari had done the sensible thing and kept the
Falcon at a lower price, put a monitor and some decent sofware with it
from day one perhaps we would have seen it as the 'next Multimedia system'
after all it has everything already their, dsp, lan multitasking etc.

With a bit of marketing and the taking of a few risks I am SURE the
Falcon would have sold by the ton, but thats Atari for you.

I just wish someone would buy out the Atari Computer line, improve
it slightly i.e put TOS 5 and an HD + 4meg as standard and then
we WOULD have Ataris on the high street.

Are their any risk takers out there who would do this? I know if I
had the money I would!!

Well, we can but dream...

Rod

You use Powertalk and QD GX? I haven't found a user for them ... yet. If I network my Mac a bit more I might move to PowerTalk, but I don't do DTP or printing work, so I haven't seen the advantage of GX yet; my text output is limited to mostly 12-18 point Helvetica or similar. Maybe one of these days...

Excuse me, but PCI boards come with onboard SCSI host adaptors. And don't forget we are discussing non-clones anyway. Tell an Amiga x000 user SCSI is a luxury item. Tell a Macintrash user. They won't believe you, as the IDE interface C= built into the AGA machines is crappy (checksum errors anywhere, that's why e.g. Karsten Klump sold his 120 meg IDE to a PC owner and put the Oktagon adaptor of his tower 500 into the 4000/040).
=>klump@wolf.deg.sub.org or klump@fmi.uni-passau.de

It's the solution to have for anyone who wants a sensible interface.

Mac users don't have to put up with the crap ST software that was or is still bad. Come on, an 030 running at 16 mhz is the highest Atari has for sale today !!! I have not had any crashes in weeks caused by Zterm.
Your pathetic software base can't even tough the PC and Mac software base. I know its tough for you, but the world has left you behind..Still having dreams about an Atari comeback?

No, sir.. Like I said, the republicans went to the polls in larger numbers than the Democrats. However, the democrats came through in Virginia and california in the Senate races because there was a need to do so. People voted because

they wanted change, not a certain ideology. Many in the electorate do not
really know what the Republican agenda is. When that is known, public opinion
will set in and influence public policy either to the likings of the
Republicans or not.

Clinton's approval ratings is above 50%. So your characterization is untrue.
The Democrats who lost espicialy in the Senate ran away mistakenly from their
records and campaigned like Republicans which alianated their traditional base.
Why not vote for a real Republican? however, in the Senate races in Virginia
and massachusettes, Robb and Kennedy defended their records and prevailed.
Like I said, Public opinion will influence Clinton and the Congress once the
Rebublican agenda is put forward to the public. The public will pretty much
have influence in what gos on.

Sorry to jump in, and I am not a lover of the Macintosh platform but
those comments don't have any basis. If you have not seen a PowerMac then
don't talk. AND PLEASE READ, the article said 1.6% of the speed
of an application *compared* to running a native application. This
1.6% probably must be in a heavy floating point application. And probably
they compared it against a 40Mhz 68040 Mac. I'll check out
that issue.

But absolutely, a PowerMac emulating doesn't run MacPaint slower than
the original Mac. Please refrain from making silly comments if you don't
know what you are saying.

And yes, I have used the three original PowerMac models...

|>I smell a new C= in the making. :-)

|>NOW they need IBM's help to port THEIR OWN operating system. Makes me wonder...

|>So, Peter, when do you think that bankruptcy hearing will be scheduled?

Maybe you are talkinga about ATARI? Believe me, Apple is a big big
$$company$$ right now (particularly when compared to ATARI) and ATARI
is far FAR more likely to go under right now than Apple. Remember:
ATARI *went out* of the computer business. At least for now. They

are betting *everyting* on the Jaguar, and while I like the Jaguar,
more delays in games are making it suffer. There's even a chance
that the 32x DOOM might show up *even before* the Jaguar!

Does anyone else find this really amusing. I am refraining from saying
what I really think of your logic right now. My job is to try and crash
them. I had Unix hackers throwing everything they could at it. Once a
day is good.

Secondly you made another error. I do not consider myself a Mac person.
I consider myself an Amiga person first, and open minded to other
computer platforms.

One last thing, I have never purchased a Mac (at least that is what I
assume you meant by shoddy computer). I get paid to work on them. I
have yet to see a computer that I consider shoddy. Each has good points
and weak points.

Oh peter you almost make me laugh. For your information, I am typing this
right now on a 486/66 PC. My falcon, because of the need, has been dedicated
to only running Notator Logic. Now, this claim of "crap software" on the ST
is just that--crap. For tasks performed by normal people (read 90%) who
use computers, ST software is just as good, easier to use, less buggy and
in many cases quicker than the PC or Mac equivalent. Oh, and much much
cheaper. In fact, the oinly reaspon I have a PC is because I got it free. If
it was my $5000 to spend (and it takes that much to get a computer that
does more than the Falcon) I would have gotten a Medusa.

Pull your head out of your disk drive and see the light, Petey.

As for your assertion that Atari computer hardware is cheaper does not hold water. As for ST software being as being better than the the other platforms is your opinion and not fact. I see the oposite. How does the Atari version od Strata Vision Studio compared to the other platforms? Answer: Not available on the ST platform..

Microsoft _is_ definitely much bigger than Apple, just look at the value of
the companies.

As for Motorola being a giant compared to Intel, it was once pointed out that
Intel make as many chips as every other semicinductor manufacturer put together.

Barry.

This could probably better rephrased as 'at least ST owners don't have to put
up with crap Mac software that _is_ still bad.'

>Your pathetic software base can't even tough the PC and Mac software base. I
>know its tough for you, but the world has left you behind..Still having dreams

Naughty, naughty, comparing the Mac's s/ware base to the PC's, to put it bluntly
the Mac software base can't even touch the PC's software base, come to think of it
I would guess that the Mac probably couldn't touch the Sinclair Spectrum's
s/ware base - the Spectrum's a damn sight more fun to use as well!

They have, the IBM (not the Apple) machines will be capable of running OS/2 warp under native mode, Microsoft are currently looking into porting a version of Windows 95(6?) across, hey with that sort of OS I might even buy one.

I wasn't aware that all PCI boards came with onboard SCSI, in fact, I really
doubt it as many PCI machines I have seen come with PCI-enhanced IDE cards
in them. Why both if they already have SCSI?

I do seem to remember reading somewhere that SCSI was _supposed_ to be
standard in the PCI system but this doesn't appear to have happened. If it
has, PC users are going for enhanced IDE in preference to it.

> > Its very rare to see SCSI drives undercut IDE prices, but for large
> >(ie > 1/2 gig) drives SCSI is the solution to have.

> It's the solution to have for anyone who wants a sensible interface.

I guess all those millions of PCs with IDE drives in them haven't
got a 'sensible' interface. Apple are also building new Quadras with
IDE interfaces (and drives) in them. Plus of course, the Falcon also
harbours an IDE interface.

Of course, the point was that SCSI wasn't standard in PCs and I think
thats pretty much a matter of record.

What a load of total tosh. If your friend bought a broken harddisk, that's
hardly a problem with the interface now, is it? I get upwards of 3/4
of a megabyte per second from my Conner 84 meg drive, and have not lost any
data to errors on the drive in the (nearly) 2 years that I have owned it.

A company that was planning for the future perhaps, a company that
realised its only way to survive was to concentrate on re-organising its
structure and dedicating itself to the mass-money making areas which
allow it to be around for a lot longer to come. I for one am happy that
Atari are still around because so long as they are here there will always
be a glint in the Falcon's eye.

: > There is no phoenix for the CBM fire.

: Lets hope not. I want to see a new management.

And a few new machines wouldn't go amiss either.

: Ever heard of Babylon 5 or Robocop or Seaquest DSV? And as for video
: titling the Amiga rules supreme in the amateur and semi pro markets.

And he falls for it.. hook line and sinker. I said VIDEO ANIMATION, I was talking to a real Amiga advocate the other day who uses his Amigas for video production and he clearly told me that for titling it reigns supreme but for animation most serious studios will use more top-end hardware. If that isn't the case then why didn't they do Jurassic Park or Terminator 2 on Amigas? This is the way things are going now.

: Its not like the situation where recording studios are defecting to
: the Mac from the ST - other machines just _can't_ do the things video-
: wise that the Amiga can. The STs midi popularity came from the fact that

Yes they can and production studios are moving to other platforms, if they have not done so already. Angel Studios for example - Lawnmower man didn't come from the back of an Amiga chipset. You state Robocop, B5 and DSV, sure they are examples, but for real _modern_ video animation you don't use Amigas. And don't get this post confused with video TITLING please. I'm not talking about that.

: STs had the midi ports as standard, there was nothing 'better' about
: them for midi use than any other computer.

In most cases there still isn't esp. for a power-price ratio.

Yes but I wonder which one of us. I was just going from evidence such as adverts in Wired magazine where they claim in their blurb things like 'time to move up from your Amiga now'. You really think I'd make a quote like that in this lions den without having something to support it? Deary me.

>>If you need the speed to run Windows, get a Houdini.
>>
>>-Peter
>>
>WHY? A PC compatible is _cheaper_ than the damned Houdini board!!!!

You think so? But you are wrong and here is the reason why..

Apple Unveils MS-DOS- and Windows-compatible Power Macintosh
System and Card
LAS VEGAS, Nevada-November 14, 1994-Strengthening its
commitment to provide cross-platform compatibility between the
Macintosh and Windows/X86 platform, Apple Computer, Inc. today
announced the Power Macintosh 6100 DOS Compatible system and DOS
Compatibility Card for Power Macintosh 6100 and Macintosh
Performa 6100 Series. These new products combine the exceptional
price/performance value of Apple's RISC-based Power Macintosh with
the capabilities of a Windows- and DOS-based personal computer.
In addition, the products offer customers the ability to easily
integrate Macintosh into mixed computing environments as well as
allow x86 PC users to bring their favorite DOS/Windows
applications with them as they move to the Macintosh platform.
Announced here at Fall Comdex '94, Apple plans to begin shipments
of the Power Macintosh 6100 DOS Compatible system and DOS
Compatibility Card in the first calendar quarter of 1995.
By removing compatibility as a barrier to consider Macintosh,
the Power Macintosh 6100 DOS Compatible is expected to attract new
customers to the Macintosh platform. These products build on the
market success of previous cross-platform products such as the
Customers Can Run Full Range of Macintosh, DOS and Windows
Applications Powered by a PowerPC 601microprocessor and a 486
DX2/66 microprocessor, the Power Macintosh DOS Compatible system
runs more applications than any other personal computer on the
market. It runs the widest range of mainstream PC
softwareQincluding DOS, Windows, and Macintosh applicationsQin
addition to the more than 360 native applications which have been
optimized for Power Macintosh. Ideally suited for home,
education, and business customers who work in mixed computing
environments, these products enable users to easily switch between
the Macintosh and DOS computing environments with a simple
keyboard command.
For example, customers in small businesses or home offices

have the flexibility of working with a full range of programs and files to meet their clientsU needs. At home, children can run Macintosh programs that they use at school while their parents can work on DOS/Windows files from work. Medium and large businesses have the ability to connect to the corporate network to utilize printing and file resources.
"By running Macintosh, DOS or Windows programs, the Power Macintosh 6100 DOS Compatible system gives customers the applications in the industry," said Ian Diery, executive vice president of Apple's Personal Computer Division. "This hardware option, in conjunction with our software solution incorporating Insignia Solutions' SoftWindows product, demonstrates Apple's continuing commitment to cross-platform solutions and helps to remove compatibility as a barrier to moving to Macintosh."

Product Features and Enhancements
The Power Macintosh 6100 DOS Compatible features dual processors, enabling users to work in both Macintosh and DOS environments simultaneously. A PowerPC 601 RISC-based processor powers the Mac OS computer environment while a 486 DX2/66 microprocessor runs both DOS and Windows-based software. Working independently, the dual processors allow users to run Macintosh and DOS or Windows applications in tandem, and even copy and paste information between the two environments.
"We have worked with Apple to enable PC users to run Power Macintosh applications as well as Microsoft Windows applications on the Power Mac 6100 and Performa 6100 series," said Joachim Kempin, senior vice president of OEM sales at Microsoft. "Microsoft and Apple believe that customers of these systems will
The Power Macintosh 6100 DOS Compatible improves on the technology of the popular 68040-based Macintosh Quadra 610 DOS Compatible awarded "Best System" by Byte Magazine at Fall Comdex T93. Featuring a faster processor than its predecessor, the Power Mac 6100 DOS Compatible also offers enhanced multimedia capabilities, such as built-in support of Creative Labs' Sound Blaster chipset for 16-bit audio playback, as well as improved networking compatibility with support for NetWare(IPX and TCP/IP network protocols via an ODI-compliant driver.
"We're delighted that the DOS Compatibility Card for Power Macintosh 6100 supports NetWare," said Richard King, executive vice president, NetWare Systems Group for Novell, Inc. "We believe customers of the DOS Compatibility Card will find that NetWare compatibility is a key requirement for integration into corporate computing environments."
Dual monitor support, provided by the Power Macintosh 6100 DOS Compatible, allows customers to add a second display without purchasing an additional video card to view the Macintosh and DOS environments simultaneously. The Power Macintosh 6100 DOS Compatible supports most VGA, SVGA and multisync monitors, as well as all current Apple displays.

applications. The optional double speed internal CD-ROM drive runs Macintosh, DOS, and Windows CD-ROM discs, providing users with access to the hundreds of exciting CD-ROM titles currently available. In addition, DOS and Windows applications print to any Apple or Macintosh-compatible printer through the built-in serial or ethernet ports.

Reply Corporation First Licensee of DOS Compatibility Card Technology
Apple also announced that Reply Corporation [(800) 801-6898], a manufacturer of system enhancement products based in San Jose, California, has become the first licensee of Apple's DOS Compatibility Card technology. Reply intends to manufacture and market DOS-compatible cards for a range of Macintosh systems including the Quadra 610, 650, 660AV, 700, 800, 900 and 950, and Centris 610 and 650.
"Through our agreement with Apple as their first licensee, current Macintosh users in mixed environments, whether at home or in business, have the broadest range of applications available to them using our DOS on Mac Card," said Russ Rogers, general manager of the Apple Products Business Unit for Reply.
Availability and Pricing
The Power Macintosh 6100 DOS Compatible system is expected to be configured with 16MB of RAM, a SuperDrive floppy disk drive, 350MB hard disk and built-in ethernet port and is anticipated to have an Apple price of US$2,499. The DOS Compatibility Card may be installed in Power Macintosh 6100 systems or Performa 6100 Series products and is expected to have an Apple price of US$699. Both the system and card are expected to be available in the first calendar quarter of 1995. Specific pricing and availability will be announced at a future date.

Apple Computer, Inc., a recognized pioneer and innovator in the information industry, creates powerful solutions based on easy-to-use personal computers, servers, peripherals, software, online services, and personal digital assistants. Headquartered in Cupertino, California, Apple (NASDAQ: AAPL) develops, manufactures, licenses and markets products, technologies and services for the business, education, consumer, scientific & engineering and government markets in over 140 countries.

Rod,
You cannot compare Atari to Nintendo. Atari runs on a _MUCH_ tighter budget than the big N. For this quarter, I believe Atari predicted a $3 million loss. This is with advertising for the Jag on a larger scale than any other Atari product I can remember. Here in the States I see Jag ads on national television and 3 or 4 print ads in every gaming mag. The big problem is games. If they get the games out soon (and good ones) then they could still make it. Doom is a good start and should be out soon. I had high hopes for CFII but it was trashed in a gaming mag (but I will wait for the verdict on the Net).
Also remember that Atari got $90 million from Sega. This will help quite a bit. Quite frankly, I am impressed with Atari's marketing of the Jag. I am disappointed with the 3rd party game developers.

Ah..yes..but intel chips suck.

It was once pointed out that Atari's purchase of ROMS was larger than
the sum total every other companies purchase in the world...

Look at the quotes. Babylon 5, Seaquest DSV and the TV Robocop all use
Amigas in their animation. I suppose thats not a serious enough use....

Umm, what exactly do you mean by "modern"? B5, Robocop - The Series,
seaQuest DSV, Hercules, Earth II (the series, not the movie :), the final
episode of ST:TNG, the displays in the jeeps in JP, M.A.N.T.I.S.,
X-Files, The Tonight Show, Late Night with Conan O'Brien, MST3K (Joel
Hodgson is an avid Amiga fan, and has squeezed in mentions of the Amiga
or VideoToaster in quite a few episodes :), The Prevue Channel, etc.,
etc. are all what I'd consider "modern" and ALL use(d) Amigas...

Anecdotal evidence: In our office, we've got 19 Macintoshes of various stripes
running the usual Microsoft apps. One had a hard disk go bad. In 19 months,
as long as I've been here, that's the only bad thing that's happened (more
accurately, that's the only bad thing I, as ad hoc support tech, have seen).
Meanwhile, I've found myself wondering if "General Protection Fault" is the
name of Microsoft's company song; it occurs so often under Windows.

Karl's not lucky. Your situation's an anomaly, unless "on average of once per
day" is some addled guess you pulled out of your backside. I rather suspect
it's the latter.

Macintoshes manage just fine in our office. What's wrong with yours?

after the initial launch of the Falcon, just how much developement
has Atari done on the machine? What new models or add-ons have they
developed for it in the 2 or so years since release?

<CRAP DELETED>
Peter, don't EVER post this sort of crap in an Atari newsgroup again, if you want to make a point then search out the relevant information (you _can_ read can't you?) and just post the items that are necessary.

In short your post stated that the Houdini board, on its own costs $699, well I can buy a 486sx33 inc monitor, harddisk, VESA graphics etc etc for $550.

Now, what was the point that your post was trying to make again?

Barry.

I suggest you call MacWarehouse and request their 200 plus page catalog and you will be surprise in what you see. As for the hardware side of things, the falcon has not been upgraded in over two years. Ex Atari employee named John Townsend stated that the current offerings by Atari is outdated compared to the latest Mac and PC platforms and will show up in flee markets. Source: comp.sys.atari.st..I am sure he has received plenty of flame mail. Meanwhile, PowerPC boards are available for the Mac 470's, 570's and 630's. Cost:$599, much less than an outdated 040 solution on the Atari platform..

On my A1200, I would get regular crashes with guru messages popping up..

The Duo PowerBook I am using(2-3 hours of usage each day) has not crashed in months. Earlier crashes were caused by Z-term when the Powerbook was in sleep mode.

Source record: 14757

I've got an 48k 800 with two of the drives that came out about the same time the 1200 did (wore out my first two drives) and the serial interface box. I think I gave away the cassette player. I've been keeping it because of the couple hundred games I've got on disks but haven't used it much. Is this stuff of any value anymore?

: of the Jag. I am disappointed with the 3rd party game developers.
: -scott tirrell

I see what you mean by not comparing Atari to Nintendo, but at the end
of the day they are both competing in the same sector. At this stage
Atari has a substantial product lead over Sega and Nintendo, but here
in the UK the advertising is still sparse. For example Sega and Nintendo
both have TV adds, Atari from what I have seen doesn't. Also Atari still
hs the image of 'oh they were popular a few years ago', if it wants to
shift Jags and Falcons for that matter it's going to have to get some
kind of strategy. Product placements on Tv and in Films, and a well
as an organised sales, distribution and marketing plan.

To be honest with you Atari are bloody awful at all of these. For example
I emailed them to ask for details on some of there products. They simply
referred me to another company, ie they dont even appear to know there
own products.

If Sega and Nintendo can come from nowhere (in the context of home
games systems) then so can Atari, its quite simple, marketing, distribution
and continual product inprovements (software and hardware wise) are ESSENTIAL
to the survival of any platform. Just look at the ST. The Tramiels had the
chance to make a go of things and until the Jag they chose not to.

As for software wise, this is dur to the fact that Atari has not marketed
it successfully across the US and Europe. If Nintendo can shift X million
units, why should a games developer put out a game for a platform of about
250,000. I know I wouldn't. Just look at the Falcon, it is a nice machine,
but had NO marketing, hence all the games developers jumped ship. I know
I bought mine from one of them!!!

Raist, read the but that you (?) highlighted in the text. I quote :-

> The facts are that Atari is out of the PC business and took write-offs in this area in 1993.
^^^^

Yes, it says the _PC_ business. Atari used to make IBM Compatible PCs. I believe that this is what is being refered to here, not the TT or Falcon. Atari still make batches of machines
on demand AFAIK, which is why Falcons are still available. (You can now get a 4/85 Falcon for
552 UK pounds + VAT from Gasteiner according to their ad. in ST Format 65)

Raist,
1) Don't you believe that Atari was kind of forced to say what they did to please investors? 2) Atari has said that they produce Falcons when needed (can the same be said for C=?) 3) The technology has been liscenced to others (can the same be said for C=?) 4) The company policy of Atari has been to funnel profits from Jaguar into the computer market. You can choose not to believe Atari but it is what they've said and I haven't heard any different. 5) Do you really want to see Atari stop making computers and be one step closer to having no alternatives?

Sorry to have to play devils advocate here Richard (I own a falcon) but
the Amiga compilers are actually better than the Atari ones. The HiSoft
Lattice C compiler & the Amiga SAS C compiler actually came out of the
same code base (the original code was licensed to both companies by Lattice).
But SAS C is now a much better compiler than Lattice, having had much more
added to it in the way of C++ support, source level debug, etc.
Lattice is ok, but the lack of a source debug is a real pain, as is C++ support
(it's not there). Yes I do have GNU C/C++, but it takes oodles of memory to
compile a simple hello world, and takes forever - no way I could use it as
my main development enviroment (I know Warwick does, but he's got a TT which is
faster and has more memory than I have). That isn't to say that some
dev software isn't top notch. Pure Pascal is the best Pascal compiler I've
used for any machine, even in the demo form. It's fast, it's source debug
is excellent. I've not used Pure C, but I assume it's of comparable quality.
Unfortunately these are only available in German.....

|> Raist,
|> Effectively Atari is out of the computer business, you are right.
|> But, they still do manufacture Falcons and TTs when demand warrants
|> it as far as I know. The TT is used in the Jag development system.

How? I mean, they admited they are no longer in that business.
The TT is used in the Jag development system but also is the PC,
which is far more likely that a developer will already have and thus
is less expensive.

Also, they may have some TT's in stock. Add to that,that
you don't need hundreds of new development kits for the Jaguars.
At this point, probably even no more (I mean, developers interested
already have one).

|> If the Falcon has been out of production how is that dealers have
|> them in stock and the price is not rising (and falling in the UK)?

Because they already got it in stock. As it was produced in
XXXX numbers but only YYYY numbers have been sold up to date.
Compare this with the CD-32: it's selling again, and yet
C= can't be producing it.

|> When the TT was out of production it was nowhere to be seen. Do
|> you think that they produced that many more Falcons than TTs?

Probably. Also consider that the TT might have sold more?

|> Atari, last I knew, was still sticking to the policy that Jag profits
|> would be funneled into the computer division. They may have changed.

Nope. Not anymore. And of course, they changed. Add to that
that ATARI is still losing money: the last official report was
about 17.x million, and in the next one, they are saying they'll
put about 3.5 millon of loss (less, but still a loss and in red).
So don't expect they are going to look at the computer business.
Not when the Jaguar is still strugling.

|> Of course, Atari has liscenced the Falcon technology out so there
|> will be clones coming out (and some are out). Besides this I have
|> heard grumblings of 060 boards for the Atari line. The situation

Yep. So? They are not in the computer business anymore.
They said it themselves.

|> is still better than that of the Amiga. Atari has also continued

WHAT?!!!! You must be joking dude. There are more than 3 millon
Amigas out there, and more than half a million are AGA machines.
I don't see in the Falcon software with the quality of Real 3D,
LightWave, ImageF/X, Scala. Where are those? LightWave
just got an upgrade, so did ImageF/X and Real 3D.

|> showing a willingness to let others improve on their software.
|> They just gave the rights for LDW Power to Compo according to
|> ST Informer.
|> Also, Raist, are you really that happy if Atari no longer makes
|> computers? What does this prove? What was your point? Falcons

Actually no. But my whole point is to those that bash the
Amiga, or think "ATARI is doing fine, thank you."

|> are still easy to find which is more than I can say for the 1200.

That situation might change soon though. Well, but when you haven't
sold even half of a half of a million computers, then that certainly
means they should be easy to find (who wants one?).

Dunno, but it seems to be wrong with mine, too. If it crashes three or four times during a day I consider myself lucky, and six or seven is average. I've NEVER had a day when I've used it and it hasn't crashed at least twice, and I don't go out of my way to make it crash - I just USE the damned thing. Granted it's far more stable than Windows - I can crash a Windows machine in less than 15 seconds without even launching an application, and I have crashed the "uncrashable" NT a couple of times - but it's far less stable than my A500, which may crash once or twice a week with "normal" use. (I tend to treat it a lot more harshly than the other machines on occasion, and then (and ONLY then) does it die on me.)

4731. Atari Lynx 16-bit color portable for sale!

Newsgroup: comp.sys.atari.advocacy
Date: 1994-11-16 22:15:43 UTC
From: SA073@getty.onu.edu
Message-ID: <SA073.841.2ECA848F@getty.onu.edu>
Source record: 14767

I have a complete system. It is an Atari Lynx, 16-bit portable gaming system. It has a color LCD screen, with an electroluminescent backlit screen, so you can play it in the dark, wherever you go. It works with 6 AA batteries, or you can run it off of a 9v ac adapter.
This system has stereo sound. It is also a 16-BIT system, not 8-bit like the Sega Game Gear. I guess you could say that it is like having a portable Genesis with a screen. There are over 70 games available for the Lynx, and more coming out. You will find favorites like Ms. Pac-Man, Joust, Quixx, Ninja Gaiden, Lemmings, and a lot of others I can't remember offhand. There are some new ones as well, like Desert Strike, from Electronic Arts. Most of these games are available for around $20 each, from Atari or other mail order places. I will give the related phone #'s to whoever buys the system. In case you are wondering why I am only selling one game with the system, it is because I now have two! (I will need the rest of the games for my Lynx II) Oh, I almost forgot - the Lynx is the only portable game system that is designed to work with either left or right handed individuals. It has a double set of controllers, and with a push of a button the screen flips upside down (or rightside up, depending on your point of view) and you can enjoy playing left handed with the 2nd set of buttons. This isn't all that important to those of use who are right-handed, but I just thought I'd let you know.

Keep in mind that a Sega Game Gear, which has a smaller screen, (and is only 8-bit) costs $89 without a game, and $119 with a game. I would like to sell this system for the highest bid I get in the next 10 days. If I get a really good bid within the next few days, I may simply end the sale right then & there, because I don't really like auctions much myself. I would also consider trading the system for about 4 OEM CD games, but you would probably have to be a dealer or at least have access to a good selection to be able to get the ones I want. If interested, e-mail me.

I am including:

The Atari Lynx 16-bit base unit
6 new alkaline batteries (batteries included, wow!)
ac wall adapter, to use when you are near a wall outlet
and a free game of your choice!
(pick one from the following list)

Gates of Zendocon (shooter) This game has over 50 different levels! You can get power ups, have side shooters, etc. My favorite is the flying eyeball that shoots fire!

Rampage (the classic "monsters smash up the city" game) This has the original 3 monsters, plus another mystery monster you can play!

Gauntlet III (explore the dungeons, get the keys, fight hordes of ghosts, giant scorpions, the undead, etc.) This one lets you be the wizard, warrior, valkyrie, punk rocker, nerd, cowboy, pirate, and several others. Each has different attributes.

Just a thought. Does how often you crash a machine matter if you are doing bad things. I mean I can set up a Mac that rarely crashes, I can set up an A1200 that rarely crashes, with some work I may even be able to do the same for an MS Windows environment (I wouldn't guarantee this though). Anyway every machine crashes. Every machine can be set up to reduce the risk of a crash. Anyone who says when I use my xyz machine it never crashes, and my abc (no relation to a real old computer) computer always crashes, should look into why the abc machine is crashing all the time. There is probably an incompatability somewhere that could easily be fixed/patched.

Basically saying a machine crashes all the time is useless. I use a Mac and own and use an Amiga. The only reason the Mac crashes is because I try real hard to find flaws in software. Same with Amiga.

[lots of stuff about Macs repeatedly crashing]

I find it quite odd, all these reports of Macs crashing 5 or 6 times
a day. I program, hack and screw around w/ my 'puter, and I have not
had a _computer_ crash in several months, and my first app crash in 15
weeks was today, because of a poor app. My Mac is on and off
repeatedly throughout the day, with a total of something in the range
of 10-13 hrs. a day, and I rarely have these crashes. My 'puter is a
Mac Classic w/ only 4M RAM, so you would expect more crashes from apps
that expect Color QD and aren't careful w/RAM. Maybe Apple's computers
are getting shoddier, or (my opinion) you are using poorly programmed
apps. It is impossible to write an OS that cannot be deliberately
crashed, and it appears that certain Micro$quish products crash rather
too easily. Hmm...

I do not own a Macintrash, but I found the MS-DOS/WIN compatible
Macintosh message to be informative and relevant. It was also priced
reasonably and was full-featured, so what's the prob?

Of course, the real reason I replied to your message is that I'd
like to know where I can buy COMPLETE 486SX/33 systems for $550? Please
post the source of this. If that's the case, then perhaps it may render
a PowerMac solution out of the question. However, I'll have to see such
systems at $550 to believe it.

James Wood

4736. Defending Atari?? Give it a rest!!!

Newsgroup: comp.sys.atari.advocacy
Date: 1994-11-17 07:37:14 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>

Source record: 14775

I've been following this base for several days, reading the messages and holding my belly in laughter at some of the preposterous claims that have been spouted.

Now, don't get me wrong. I have a house full of Ataris which I find very dear, but there was a time and a place for Atari. WAS. I enjoy my Ataris even today, but only because of NOVELTY and REMINISCENCE. Any talk of Atari computers in the same sentence as modern PENTIUMS or POWER MACs is simply ridiculous.

Atari's initial success was acheived because in the old days, Atari products were MORE INNOVATIVE than the competition's, and cost LESS. The original Atari 800 offered more than the original Apple II, for much less. The original Atari ST offered more than the original Macintosh or 8088-based PC's - again for LESS. However, things changed.

The only point at which Atari even stood a chance at dominating the industry (that is, the only time duirng which there may have been the potential to do so) was in 1985 with the introduction of the Atari ST. At that time, Atari had tecnological advantages over the competitors, and delivered them at more affordable prices than the competitors. Had that not been the case, I would not have owned an Atari ST. However, any other company would have been hurriedly working on the next generation of machine. They would have been open to criticisms of the current machine and working hard on improving the next generation. What followed the ST was YEARS of Atari stagnation and neglect. When Atari finally decided to improve upon the ST, it was too little, too late, and too incompatible with previous ST machines.

With each year that passed, the MS-DOS machines got better and better. VGA was introduced in 1987, which was vastly superior to anything available on the Atari. 386 computers were introduced. Of course, those were both very expensive at time of introduction, but the PC has simply been a story of falling prices for years now. As prices have been falling, performance has been increasing. All during this time, Atari fell further and further behind - not only did their prices NOT fall commensurately to the PC world, but what new high-performance hardware was even available for the Atari????

I got tired of waiting, which is why I sold my ST in 1990 in favor of a 286. Back then, I had a machine twice as fast as my ST, which I put together from parts that I obtained for very little more than I SOLD my outdated ST for. Since then, I've had the enjoyable experiece of tecnological innovation and price cut year after year....386, 486, 486DX2, 486DX4....etc. I've also had the most software choices possible on the planet. (The Atari emulators are some of my favorite software.)

The biggest problem with Atari computers has been the Atari Corporation - specifically, the Tramiels. I don't believe ANYBODY could have topped them for marketing screw-ups. Due to them, Atari hardware has fallen from being advanced and low-priced to obsolete, high-priced, and they even introduced the factor of UNRELIABILITY.

Take the Atari XF551 disk drive, for example. The PC board inside is of such low quality that simply plugging in the SIO cable a few times will BREAK THE TRACES on the board, developing intermittent drive problems. Atari machines were always notoriously difficult to upgrade, and since the Tramiels, NOTHING is socketed - it's all soldered on the motherboard. Atari ST floppy drives (by Chinon) assembled with glue that would come apart. Atari equipment under Tramiel was of the absolute lowest quality. On the XE line, the parallel expansion bus (from the 800XL of the previous Atari) was butchered such that the first thing the third party did was develop an adapter to take it back to 800XL format. On some then-new machines (such as the 65XE) the parallel bus was completely omittted - which is probably why the 80-col. adapter (XEP80) turned out to be a slow joystick port kludge that even the most shameful third party developer could have done better.

Since I got tired of waiting for a TT and bought a PC clone, I never owned one. However, I was glad that I didn't after finding out that the TT wasn't even fully compatible with the ST. Could there be anything WORSE than that?

Finally, Atari corporation has acquired perhaps the worst reputation on the planet. I was one of the 8-bit Atari users who had Atari turn their backs to me. I suppose now, ANYONE who uses an Atari has had Atari turn their backs to them. Atari even burned their distributors and dealerships. Who hasn't heard of Atari dealers upset because of the Tramiel tactic of letting small dealers do their pioneer work for them when the machines are new, only to dump Atari equipment on mass-merchandisers who reap the profit? Atari showed no loyalty to the mass-merchandisers, either - many of whom won't even carry Atari products because Atari wouldn't ship on schedule, if at all.

Who hasn't heard of Atari Vaporware? Let me try and think of some Vaporware.... Atari promised CD-ROM in 1985. I waited 5 years before abandoning the Atari platform, and finally got my CD-ROM from Soundblaster (for PC). What happened to the 65XEM and 130ST?
I've forgotten how many products were announced and never delivered by Atari - which was a common occurance. CES and COMDEX must have been simply Atari smoke and mirrors with all the products announced and never shipped.

The TT and Falcon were overpriced and outdated at introduction. How can anyone be excited about a computer company in the mid-90's whose flagship machine is a 16Mhz 68030 - and it won't even run software from the 8Mhz 68000? Need I say more? Atari has even burned those users by dropping them, too (in addition to pedaling them shoddy hardware). It's because of Atari's reputation catching up from them that the Atari user base has dwindled, and because of that that good quality software for even the TT

and Falcon has been at a minimum.

And now we have the Jaguar. Sure, they talk about a CD-ROM reader for it...but there's that damn Atari policy of Vaporware that comes to mind. I'll believe it when I see it. There's also the problem of software - as in "none." What right-minded developer wants to waste time developing for a machine from a company with the reputation like Atari's? Sadly (for the Jaguar) its biggest drawback might turn out to be the name and logo of the company which sells it. Atari hardly stands a chance in coming up from the bottom in the nearly-saturated video game industry. Nintendo gained their huge market share in the late 80's with the original NES. The market was different then, since the ENTIRE video game industry had fallen off after the Great Video Game Shakedown of the early 80's (when Intellivision, Coleco, etc died). Now, the huge video game market has built up again to the same cut-throat competition. If Atari had introduced innovative video game hardware back when the original NES was gaining a foothold, they might have stood a chance - but the market is different. There are too many players now, and those who dominate the video game industry have done so by demonstrating a market proficiency orders of magnitude beyond Atari. Competiton is only slated to increase with the introduction of systems by big players such as SONY playstation. Thus there are an awful lot of factors working against the Jaguar - and Atari.

The ironic thing is, Atari has had some of the most loyal followers in the industry. I used to feel that way myself - until I woke up and smelled the solder burning. Year after year of being neglected and abandoned, there are still loyal Atari enthusiasts. This late in the game, I wonder how that is possible. However, if there is a company on this earth who can figure out just one more way to screw over the bedraggled remnants of a once proud and mighty loyal following, rest assured that Atari is the one. If any other company would have had even a fraction of that loyalty shown towards them, they would have made a fortune....and built upon that loyalty by continuing to satisfy customers with innovative hardware at value prices.....but that's a dream. Perhaps that's something for you dreamers to put in your pipe and smoke.

I enjoy my Atari hardware even today, but I'll never put it on the same tier as Power Mac and Pentium - both of which have left Atari in the dust.

Ever hear of Commodore? Mehdi Ali strikes me as being about 1000x
worse than anything Atari have ever done. At least Atari tried to do
the right things. Under that wanker Ali, it really looked like C=
were _trying_ to commit suicide.

Thank god the Amiga is free of them now. Lets hope the lawyers don't
screw the Amigas chances of recovery under a new manufacturer.

Yes, but you seem to be one of the few Amiga users on this group that it's possible to have a civilised conversation with. My statement above refers to the general opinion of the Amiga owners I've met, of course they're not all like that. BTW I'll be purchasing an Amiga myself soon, but that doesn't mean (I hope) that I'll end up like most Amiga owners ;-)

Have you not been into Debenhams recently? They have Falcons (or at least the one in her in Manchester and the one in Bristol have....)

I bought mine from a shop (not mail order). This was just a small computer shop in Bristol, and had just as many Falcons as A1200s.

No, he didn't. You misunderstood.

|> was talking to a real Amiga advocate the other day who uses his Amigas
|> for video production and he clearly told me that for titling it reigns
|> supreme but for animation most serious studios will use more top-end
|> hardware. If that isn't the case then why didn't they do Jurassic Park
|> or Terminator 2 on Amigas? This is the way things are going now.

Dude, did you know that the low end market for VIDEO ANIMATION is Amiga?
Did you just know that? And while we are at it, did you know that
for Jurassic Park (yes, Jurassic Park) more than 10 animated story
boards for conceptualiztion where done on the Amiga with LightWave?

True, SGI's are used for a bunch of movie stuff, but one of the reasons
why shows like Babylon 5, Seaquest, Robocob TV series, Star Trek Next
Generation (yes, those two went with it in the final seasons) use
Amiga's because it is price competitive enough?

Don't just tell me "ah, for video animation" because for Video Animation,
the Amiga also kicks butt. Yes, the very high end is Silicon Graphics,
that doesn't mean you can't do quality works on the Amiga.
Why don't you read an article that came out in Computer Graphics World about it?
There's even experienced people that acknowledge that Real 3D has more power
as a procedural animatior than even Alias and SoftImage! And I am not
talking about 'just Amiga advocactes' but very experienced people in this
industry.

Now I ask you: why if the SGI is "THE SOLUTION", then why more and more
people where starting to use Amiga's for high quality TV work? And if
you think that the Graphics on Babylon 5 are not high quality.. then...
(they got an Emmy for *just* the graphics effects?) Babylon 5 was
the very mark of "quality *video animation* can be done on the Amiga".

Remember that you don't do a movie (a $$$movie$$$) like Terminator 2
or Jurassic Park every day. That's where the Amiga comes in, providing

high quality graphics at an affordable price and that's why Babylon 5
is possible, why Seaquest is made possible, etc. Budget wouldn't permit
it otherwise.

And just to let you know too, do you think that the SGI's are that
fast rendering today? Wake up. A Pentium at 90Mhz can match a $40,000+
Crimsom machine. Same with Amigas, particularly accelerated with the
"warp" or "raptor" (when I say warp, there are too. I am talking about
the "transputer one", and not the '040 one). $40,000 vs $4,000->$8,000
doesn't look good. And I am not even taking into account a PowerPC.

While the SGI has a "reality engine card" that can make raytracing
type stuff in Real time... how much do you think it costs? Yes, the
card alone? Last time I heard was about "only" $100,000. The card
alone, and you need an SGI workstation too. Then add $$$the software cost$$$.
Most SGI software are in the realms of $30,000+ bucks (the most "famous"
animation software). And of course, usually you also have to pay about
$2,000-$4,000 a year for keeping the license. See why a lot of people
are using Amigas for a lot of projects?

|> : Its not like the situation where recording studios are defecting to
|> : the Mac from the ST - other machines just _can't_ do the things video-
|> : wise that the Amiga can. The STs midi popularity came from the fact that

I don't think so. The only reason why you would look elsewhere is
because of C='s current situation (bankruptcy/slow auctioning) more than
anything.

You might have talked to a video producer, I have talked to several.
Plus I read quite a bit of graphics/video magazines.

Strange. I've never owned an Amiga, but I was under the impression that the Amiga was marketed better by Commodore than Atari did the ST. As an ST owner, I was always "jealous" (lack of better term) of all the neat stuff that C= was developing for the Amiga line....like new models. I don't know the specifications, but the Amiga 2000 and 4000 etc seemed pretty neat IMO - although I was never truly informed in regards to the specifications of that machine. I just marched along with my 1040ST with 4MB kludged in with a difficult memory upgrade stuffed under the RF shield. I would have sprung for a Mega ST if it wasn't so expensive and redundant....essentially the same machine re-cased. I didn't figure the detachable keyboard was worth the price of upgrading. Gee, if they would have at least put in a 1.44Mb drive or included the original "STe" enhancements - or even cranked 'er up to 16Mhz - on the ORIGINAL MEGA-ST, then I would have sure-as-hell bought one. I'll bet a lot of other people would have also. Of course, to have introduced those features a couple years earlier than Atari DID would have required market proficiency beyond the Tramiels....

As for the Jaguar - I would like to see it succeed and I think about buying one, but I want to see more games and CD capability. I just read a new posting updating the Jaguar situation, and it's the same story by Sam Tramiel....."Any Day Now"....."Coming Soon!"...."We're just about there!" We've heard that story before. Have they no shame?

James Wood

In article <3aassj$1vj@darkstar.UCSC.EDU>, aspect@cats.ucsc.edu (Christopher Taylor Oates) says:

>You are lucky. In a regular office environment, where we had to have our
>macs running straight through for customer service work, each machine crashed
>on average of once per day.`
>
> ~Chris

Everyone is luckier than me. My Windows NT 3.5 crashes (to the blue screen) a minimum of once per day. Usually on the first login. Often it crashes 2-5 times a day. Yes, I know what the problem is. Its a Zeos Pentium 90. A lot of early P-90 that are based on the Intel chipset or motherboard have the same problem. Oh yeah, my wonderful mail order vendor, Zeos, is dragging their feet for several weeks now on sending the repair part (a new
motherboard). I also have to put it in myself.

Everyone knows pc's are cheaper than Mac's. Must have been said by a Pentagon accountant.

This is something that I really don't understand about people in this
group. If an app constantly crashes, use a competitors application.
I sent Word back to mail order place I got it from one day after buying
it and bought Wordperfect instead. But Zterm is notoriously buggy and
doesn't download in the background as well as my personal favorite --
Macintercomm.

Of course, Sinclap's preposterous claims for the Mac are equally funny.

>Now, don't get me wrong. I have a house full of Ataris which I find very
>dear, but there was a time and a place for Atari. WAS. I enjoy my
>Ataris even today, but only because of NOVELTY and REMINISCENCE. Any
>talk of Atari computers in the same sentence as modern PENTIUMS or POWER
>MACs is simply ridiculous.

I have two old Atari computers lying around, an 800 and an XE-130.
I also have an ancient Atari 2600 and about 25 cartridges for it.

As I remember, in the early 80's Atari dominated the video game market. Even
though Intellivision and ColecoVision were much better than the 2600, the 2600
had a much larger user base than both of those put together, and a correspondingly
larger software library (remember how Activision, a big third-party video game
developer of the time period, only released their most popular titles for non-2600
video game systems). From the inception of the home video game market at the end
of the 70's though the early 80's, Atari was king.

As for home computers, though Atari always lagged behind IBM, Apple, and C=, the
Atari 8-bits did have a significant user base (something that could never be said
about their 16- and 32-bits). I mean, in the early and mid 80's, it wasn't too
hard to find Atari hardware and software in stores (something that hasn't been true
for 7 or 8 years now). In short, Atari wasn't king in the personal computer market,
but they were at least on the map.

Those were the days...........

>Atari's initial success was acheived because in the old days, Atari
>products were MORE INNOVATIVE than the competition's, and cost LESS. The
>original Atari 800 offered more than the original Apple II, for much
>less. The original Atari ST offered more than the original Macintosh or
>8088-based PC's - again for LESS. However, things changed.

The Atari 800 had the best graphics in personal computerdom for years - then
VGA came out.

<Deletion>

>I got tired of waiting, which is why I sold my ST in 1990 in favor of a
>286. Back then, I had a machine twice as fast as my ST, which I put

>486DX2, 486DX4....etc. I've also had the most software choices possible
>on the planet. (The Atari emulators are some of my favorite software.)

The large software library is definitely enjoyable. And you know that it
will remain large because no software developer in their right mind would
ignore over three quarters of the personal computer market.

As for technological innovation, it's fun except that it makes your machine
obsolete in less than TWO YEARS. This is a big annoyance if you can't
afford to buy a new PC every two years. My computer, a 16-MHz 386SX, is
just begging for the scrap heap, but I can't afford to buy a new computer
right now, so I an forced to stick with it. Oh well...at least it runs
Civ well.

<Deletion>

Every own an Atari printer? They were horrendous! Mine always bent the
lines at the bottom of the page. Also, remember when they upgraded Atari
DOS 2.0 to Atari DOS 3.0? Atari DOS 3.0 had so many compatibility problems
with 2.0 that they were forced to "downgrade" it to 2.5.

>Since I got tired of waiting for a TT and bought a PC clone, I never
>owned one. However, I was glad that I didn't after finding out that the
>TT wasn't even fully compatible with the ST. Could there be anything
>WORSE than that?

You stuck with Atari long after I did. I switched to the PC world in 1988
and stopped following Atari completely the following year. Never even heard
of the TT until I started reading this newsgroup.

>Finally, Atari corporation has acquired perhaps the worst reputation on
>the planet. I was one of the 8-bit Atari users who had Atari turn their
>backs to me. I suppose now, ANYONE who uses an Atari has had Atari turn

>mass-merchandisers, either - many of whom won't even carry Atari products
>because Atari wouldn't ship on schedule, if at all.

Atari sure did turn their backs on their 8-bit users - and at a time when
they were over 90% of Atari's installed base. From about 1986 on, all
Atari Explorer (nee Connection) ever talked about was the ST. If you
owned an 800, an XL, or an XE you were out in the cold. No wonder so
many Atari 8-bitters switched to either the PC world (like me) or the
Mac world (like that no-good from Iowa). Who wants to own a computer
from an untrustworthy company - especially when other kinds of computers
are much better supported.

<Deletion>

>The TT and Falcon were overpriced and outdated at introduction. How can

>orders of magnitude beyond Atari. Competiton is only slated to increase
>with the introduction of systems by big players such as SONY
>playstation. Thus there are an awful lot of factors working against the
>Jaguar - and Atari.

The sad thing is that Atari was the dominant player in the video game world
at one time. But they let it slip from their grasp by failing to come up
with a good upgrade to the venerable Atari 2600. Now Atari's presence in the

video game market is as negligible as their presence in the personal computer market.

<Deletion>

>I enjoy my Atari hardware even today, but I'll never put it on the same

Agreed. I also wouldn't put the PowerMac in the same tier as the Pentium, though, since PC compatibles outnumbers PowerMacs 4 to 1.

>James Wood

It's always nice to reminisce about the good old days. It's a shame Atari has degenerated to what it is today.

The Jag development system is TT based. There are no such systems
available? The Falcon is no longer produced though there is high demand for
it in the MIDI/music section? Kid, get real, an already developed machine
that sells will be produced until it doesn't sell any more or the producer
goes bankrupt.

I can't imagine that Atari wouldenter the computer market again because of past difficulties in competeing and profitability. Atari can no longer compete in terms of hardware and software, would take a massive investment that they lack. There is no evidence that the jag will take off, I have seen onone to change my view on it. As for Apple entering the console market, I have yet to see a press statement from the company. As for needing money, Apple is a nine billion dollar firm and is very profitable.

> As for home computers, though Atari always lagged behind IBM, Apple,
> and C=, the Atari 8-bits did have a significant user base (something
In Europe, Atari kept up pretty well against IBM and Apple for several
years. Around 88/89, their sales outstripped Apple here. It went downhill
after that though :-(

> the early and mid 80's, it wasn't too hard to find Atari hardware
> and software in stores (something that hasn't been true for 7 or 8
> years now). In short, Atari wasn't king in the personal computer
> market, but they were at least on the map.
You can still walk into shops here in the UK. I have 4 shops wihin 10
minutes walk that do Atari software/hardware. Plus there are many
mail-order outlets.

> Those were the days...........
Still are, just.....

> > Atari's initial success was acheived because in the old days, Atari
> > products were MORE INNOVATIVE than the competition's, and cost LESS.
They were just damned excellent! The 800 was awesome. Wheen I see one in
a junk shop, I still get all starry eyed!

> The Atari 800 had the best graphics in personal computerdom for years
> - then VGA came out.
Better res but that's about it.

> > I got tired of waiting, which is why I sold my ST in 1990 in favor
> > of a 286. Back then, I had a machine twice as fast as my ST, which
My 486 is the same speed as my Falcon for many tasks like displaying JPGs.

> > to upgrade, and since the Tramiels, NOTHING is socketed - it's all
Apart from the RAm, TOS Chips, floppy controller (AJAX), 68K (I removed
mine to fit a PC emulator)

> Every own an Atari printer? They were horrendous! Mine always bent
But they were cheap! I had a 1029 printer. Pretty poor but it worked and
dumped graphics. A 3rd party in the Uk released a new ROM with extra fonts
for it!

> > that the TT wasn't even fully compatible with the ST. Could there
> > be anything WORSE than that?
It runs most proper stuff. Games would have trouble. The compatability of
the Falcon is amazing given that's it's effectively all new hardware and
OS. I had a couple of bits of PD and VIP Pro that I couldn't get to work
but everything else on my (350Mb - full too) HD worked first time. Even
most games work OK via Backwards.

> > The TT and Falcon were overpriced and outdated at introduction.
Tha Falcon is much cheaper now, as is the TT if you shop about. At one tme it was about 2000GBP. ow you can get a basic one for 600GBP - seen at a recent Atari show.

> > How can anyone be excited about a computer company in the mid-90's
> > whose flagship machine is a 16Mhz 68030 - and it won't even run
> > software from the 8Mhz 68000? Need I say more? Atari has even
It DOES run pretty much all ST software.

> > of that that good quality software for even the TT and Falcon has
> > been at a minimum.
This is true.

> I heard that Atari had abondoned the computer market completely.
No, they still make Falcons and TTs.

> - scott tirrell

I can agree with all those points except for number 4. AFAIK Atari have only indicated that profits from the Jaguar <may> be funnelled into the computer market, but it isn't cast in stone by any means.

Of course, a pre-equisite for that is for the Jaguar to put Atari into profitability, which is some way off in itself.

Personally I think it's being very hopeful that they will go this route - I think it's unlikely.

Your fifth point is very important though. After initially having a bit of a snigger about the news from Commodore, it struck me as being another nail in the coffin for alternative platforms to the blind rush toward PC-dom and a very backward step for the computing world.

4761. Re: Defending Atari?? Give it a rest!!!

Newsgroup: comp.sys.atari.advocacy
Date: 1994-11-19 00:08:35 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3ajfm3$c1e@nermal.cs.uoguelph.ca>
Source record: 14655

: The Atari 800 had the best graphics in personal computerdom for years - then
: VGA came out.

Well ... the Amiga and the Atari ST beat VGA. IMHO, these
machines played better games than comparable PC's of the era.

: >I got tired of waiting, which is why I sold my ST in 1990 in favor of a
: >286. Back then, I had a machine twice as fast as my ST, which I put

A 286 faster than an ST? Look at the way these machine's manage memory.
The 286 still takes information in little 64K chunks, wheras the ST takes
it in whole swoops. One of the advantages 68000 based machines have over
DOS computers. A 286 is NOT two times faster!

: Every own an Atari printer? They were horrendous! Mine always bent the
: lines at the bottom of the page. Also, remember when they upgraded Atari
: DOS 2.0 to Atari DOS 3.0? Atari DOS 3.0 had so many compatibility problems
: with 2.0 that they were forced to "downgrade" it to 2.5.

Oh gawd! I'm having nightmares thinking about my old 1027 printer. Egads
was that thing slow, loud and unreliable! And DOS 3.0 ... whew!

: Atari sure did turn their backs on their 8-bit users - and at a time when
: they were over 90% of Atari's installed base. From about 1986 on, all
: Atari Explorer (nee Connection) ever talked about was the ST.

Seriously. Atari even tried to publicly denounce the 8-bits in their own
mag. What a way to tick off users. They constanly printed letters from ST
owners urging them to "stop wasting their time with the 8-bits."

: from an untrustworthy company - especially when other kinds of computers
: are much better supported.

For me, I traded support for features. Until VERY recently, Atari always
had the best machines (technically) for your money. I didn't use them for
too many obscure things, so I didn't need all the support.

: The sad thing is that Atari was the dominant player in the video game world
: at one time. But they let it slip from their grasp by failing to come up
: with a good upgrade to the venerable Atari 2600. Now Atari's presence in the
: video game market is as negligible as their presence in the personal computer
: market.

They came up with a good upgrade. It was called the Atari 7800.
Unfortunately, Tramiel kept in on the shelves until after the NES caught
on. It was ready to go in '84 (with all the power of an NES and superior
animation capabilities), but didn't make it onto the scene until late '86.

Source record: 14659

Gee, I know I am sad blind to the facts but I am going to defend that evil company Atari! (sarcasm, btw).
As far as marketing, this is Atari's big fault. They did not let the public know about the STe, TT, etc. The Jaguar, though, has been advertised including quite a few national tv ads and tons of print ads. Atari customer support has also been criticised. I, personally, have had good luck with Atari. Whenever I'd call someone would try to answer my questions. Now Atari has an (800) number. Also, the Atari community contains some of the nicest people who are willing and able to help out people with any problems. Just get on-line! Also, just look at Mr. Don Thomas's record at Atari to see someone truly concerned with the customers. And look at companies in the IBM software market that have (900) assisstence lines.
As far as Atari turning its back on the 8-bit what were they supposed to do? Support it forever? They still answer questions about it on their help line. The XEGS was an attempt to pushthe 8-bit into more homes. Atari Explorer kept writing about the 8-bit up until its death. There were lots more developments on the ST to write about, though.
Atari products may be cheaply made but I have had pretty good luck with them. The only problem I have had is with my Falcon's microphone port in over a decade of owning Atari products.
Atari may not have dropped prices to stay competitive with PC prices. How in the world could they have, though? The ST was not made by tons of different large companies. The ST stayed competitive for awhile in Europe. Even now to get a system for music as good as a Falcon you'll be spending more money on the PC or Mac.
I would compare th Falcon to Pentiums and PowerMacs for _personal_ computers because they can handle most every home need and have a much friendlier working environment (TOS 4.04). The hardware can keep getting quicker but I have no desire to use Windows or System 7.5.
I am sick of hearing that one must buy the newest hardware to stay out of the Stone Age. When one thinks about it, the ST and Amiga have had some of the best software support in that software developers don't let their code get out of control and take 8 megs of RAM to run. Also not too much new software will run smooth on a 286 or Classic. What matters is how the machine satisfies the needs of the owner and how fun it is to use (I remember when personal computing was fun!).

As well as 800 numbers too...Gee, we have company droids on line as well to
answer questions such as Apple's Dale Adams as well as their SOS 800 number as
well.

The Mac is not made by tons of manufacturers yet, but their hardware prices are
lower than Atari's current offerings. What gives? Could you prove, even
though pointless, that a Falcon set up is cheaper?

>-scott tirrell

You think the other platforms do not have smaller software and is just on the Atari platform? You are mistaken on that point. The reason you have a lack of huge apps that require more hardware is that you hardly have any. I can run Zterm, WriteNow and ClarisWorks fine under a four megsystem. With System 7, I can reduce the funtionality which inadvertently is not available on the ST and Amiga platform to suit my tastes. I can customise SYStem 7 to reduce the functions I don't need and reduce the memory requirement.

If you like your Falcon that is fine, but to a new user, its not acceptable choice due to other offerings from other platforms.

-Peter

I installed GX mainly out of curiosity. However, it's hard to justify
keeping this memory hog installed until there are some applications out
that support it, and they have to be applications that I actually use
frequently. I'm seriously tempted right now to disinstall GX, throw out
all the converted fonts and reinstall my old TrueType and Postscript fonts.

I installed GX, then just used Extensions Manager to remove ATM GX and QuickDraw GX. Took all of 30 seconds or so...

Installing GX should not change your existing TrueType fonts in any way,
shape or form.

Yes I have and it is still not as good as an Amiga4000. If it can not beat an Amiga4000 then it is not a good animator. This is comparatively speaking of course.

> about an Atari comeback?

Yeah, right: as if APPLE is in its glory years.. We don't ahve to merge to
stay alive.. We don't sell copyrights of the OS to keep up in the storm..
And the Atari market is more specific than apples, for the difference in buying
a mac or some ms-clone has faded

I guess it is better that you dream on!

Sorry, I would have to disagree. I love my Amiga at home, and I work on Macs all day. I have grown to accept the limitations of both machines. Recently though, I saw some very smooth, full screen animations on a Mac using a PPC 8100/110. It also had no problems playing fairly large (~1/6) quicktimeVR screens (These I might add were really cool). So basically what I am saying is that I have never seen a better movie (sound and graphics) than the quicktime movies that I saw running (ofcourse a PPC 8100/110 isn't exactly a slow computer).

Later,
Rob Morton

I doubt Atari gave up on computers last year, otherwise how would they have
managed to put stuff in the shops if they didn't make anything?

If your a student and looking for a bargain, then get down to Hi Soft.
They offer a whopping 30% student discount. This meant I got Speedo
and Papyrus for LESS then the normal price of Papyrus on its own.
Total Cost: Speedo + Papyrus #112 ukp.

Having said that I wont be eating for 6 weeks to pay for it, but
who cares, I no longer have to suffer 1st Word Plus and its dread-
ed hyphens. At last different page sizes, graphics and DTPish
type facilities. Also at last I'll be able to get a bit more
USE out of my rather pricy Falcon.

I'd encourage ANYONE who this offer is open to to give it a bash,
Hi Soft offer a really good range of Atari Stuff. So if we want NEW
software for the Atari we can atleast buy it off them and give them
some encouragement top make new stuff. Whats more we save a few bob
at the same time.

Also if your keen to try before you buy Papyrus has a Demo, which I
believe can be FTP's from some places and is also available FREE from
Hi Soft.

Rod

Yes, did some of them get StyleGuide compliant after all? AdPro did, half a year ago. Sheeesh, over here one hardly is able to sell non-GEM-compliant software (and I with my real-time windows patch throw them into the trashcan anyway, if there is an alternative to them).

I don't see Amiga software with the quality of Cubase Audio for Falcon, Emagic Notator, Calamus SL, Tempus Word pro, Papyrus, or even Phoenix or the (old, but good) Technobox CAD/2 or DynaCADD. Not to mention that esp. Calamus as a modular software is "upgraded" with any new module.

> Actually no. But my whole point is to those that bash the
>Amiga, or think "ATARI is doing fine, thank you."

And instead you bash the Atari. Clever, very clever. BTW, who made the worldwide survey that says Atari sold less 680x0 machines than C=?

> That situation might change soon though. Well, but when you haven't
>sold even half of a half of a million computers, then that certainly
>means they should be easy to find (who wants one?).

The Falcon seemed overpriced in the beginning, and Atari couldn't supply the demand then due to severe problems with the production facility. _Now_ this has changed, and the Falcon is available in quantities (and there is software making use of the DSP, that's a _major_ change).

And, as a friend found out, phone an Apple dealer and ask him this:
"I want to buy an Apple to do the same things I saw on a Falcon running Cubase Audio for Falcon, what would it cost me?"
He was told to buy a Falcon instead :-).

>owned one. However, I was glad that I didn't after finding out that the
>TT wasn't even fully compatible with the ST. Could there be anything
>WORSE than that?

Yes, like asking for technological development and at the same time(!)
expecting to run old, badly written programs. All clean programs (such as
GEM-Draw, 1st Word Plus, Dr. LOGO, etc.) ran fine on the TT. It's just that
programmers considered themselves 'better' than the programmers of the ST's
OS and invented 'new, better' desktops for all of their programs, relying
on the thesis that _all_ Ataris have three resolutions and that a
'professional' user would want to run his app on an SM124.

>Who hasn't heard of Atari Vaporware? Let me try and think of some
>Vaporware.... Atari promised CD-ROM in 1985. I waited 5 years before
>abandoning the Atari platform, and finally got my CD-ROM from
>Soundblaster (for PC).

Why haven't you bought the CDAR504 in '88? And I am pretty sure they didn't
promise it in '85, this 'fact' has been made up by you.

>What happened to the 65XEM and 130ST?

Atari wasn't able to shrink TOS and GEM to 192 KBytes at first, so they
booted it from disk. This killed all machines with less than 512 KBytes
RAM surprisingly. And after the ROMs shipped, the customers (and
programmers) already relied on having that much RAM available.

>The TT and Falcon were overpriced and outdated at introduction. How can
>anyone be excited about a computer company in the mid-90's whose flagship
>machine is a 16Mhz 68030 - and it won't even run software from the 8Mhz
>68000?

And again, you are expecting any new machine to run any badly-written piece of trashy code.

>And now we have the Jaguar. Sure, they talk about a CD-ROM reader for
>it...but there's that damn Atari policy of Vaporware that comes to mind.

Well, I have seen photographs of existing Jag-CD-ROMs, so I believe they are there. Plus 'Legions of the Undead' is said to be under development for the JagCD. At least there are developer systems available.

>What right-minded developer wants to waste time developing
>for a machine from a company with the reputation like Atari's?

Well, see the list in rec.games.video.atari.

Ever hear of warehoused merchandise? It's possible that they have warehouses
full of unsold Falcons and are shipping those to stores, rather than newly
manufactured machines.

You must be running some really strange software. We have had our mac's that serve as point of sale terminals run for a coupla months straight. No glitches, no problems. Today we had a power failure in the building. Definitely the type of thing that will kill a good mac. But no, they just crashed, we rebooted twenty minutes later when the light went back on, and they booted up fine. Opend up the POS applications and went right on doing buisness.

Well, they could have done something similar to Commodore - who introduced the Commodore 128 as an upgrade path between the C64 and Amiga lines. I'm sure a lot of 64 owners thought the 128 was great.

They could have done something similar to Apple with the IIgs. Lots of Apple II owners thought that machine was great.

They could have at least sold a "260XE" or whatever....added another 128K to the 130XE. RAM prices were constanly falling even back then. They could have licensed SpartaDos from ICD and started including it with XE systems instead of developing the hiddeous DOS XE. These things would have required some insight and efficiency; alas they did not happen.

They could have left the parallel bus alone. I cannot fathom why Tramiels thought it necessary to redesign the parallel bus connector to that crappy arrangement on the back of the 130XE. The fact of the matter is that the parallel bus was one of the nicest developments on the Atari 8-bit line, period. There was already a shortage of support for the parallel bus. To proceed with disturbing the connector only served to make it even more difficult for developers to support the PBI - and ANY change was simply NOT warranted. What was the reason??? Do you suppose they might have saved 3 cents per machine? Did they believe change to be synonymous?

Of course, the biggest mistake was to OMIT the parallel bus _completely_ on the 65XE and the XEGS. 8-bit owners should have strung up the Tramiels by some part of the anatomy for doing this. Omitting it was probably the greatest statement against the parallel bus - which was the greatest thing to happen to the old 8-bits. Obviously, when it came time to market the XEP 80-column module, Tramiels committed themselves to using the kludge joystick interface, since they were selling NEW Atari XE's without the parallel bus, and they couldn't contradict themselves by using the parallel bus (as they should have in the first place) and eliminating 65XE/XEGS owners from the XEP.

If changing the connector saved 3 cents, deleting it alltogether saved 4. So did using inferior quality keyboards on the XE machines. (How many 130XE keyboards must have been replaced, total??) So was putting flimsy PC boards inside XF551 disk drives. (Leave it to Tramiels

to ____ up and introduce unreliability to the simple SIO port!) They could have done a small modification to the SELF TEST to at least make the keyboard LOOK like a 130XE. The Tramiel tactic of using as many OLD parts as possible (ROMS)and making any new parts as cheap as possible (KEYBOARDS) is why some Atari 8-bit users never bothered with the ST and either carried on with their old machines or jumped to IBM, Apple, or Commodore/Amiga. I wasn't one of that gang....but I saw it happen.

I still use my Atari 800xl system, despite having high end PCs available. Why? Because it's inexpensive, there's lots of software available, and it does what I need. Telecom? I use FlickerTerm, full VT100, eighty columns at up to 19200 baud with no additional hardware. High-quality printing? Daisy-Dot III has great fonts.

Do you still have an Atari 8-bit system around? Curious to know what's going on in the 8-bit world? Why not take a look at the Atari 8-bit Omnibus? You'll see:
- Ads from three continents!
- IDE hard drive interfaces!
- Lemmings clones!
- Hardware to make the original 800 completely XE compatible - even down to the memory banking scheme.

All this information and more for only $5 (US) shipped worldwide.

Send your orders to:
David A. Paterson
Attn: Atari 8-bit Omnibus
P.O. Box 342
Cote-St-Luc, QU H4V 2B2
Canada

Cheques or money orders payable to David A. Paterson.

> a mac or some ms-clone has faded

I'd love it if Commodore (or Atari) had licensed their OS. Think of all
of the new software people could develop due to the increased demand that
would result due to increased sales due to the better marketing of 20
companies (or however many companies) selling boxes with AmigaOS.

It would be, unquestionably, A Good Thing.

Jeez, Atari is still SELLING CPUs? In 4 years in the U.S., I have yet to find
ONE lousy store with an ST on display. I have fond memories of my first
computer, one of the first 520ST I upgraded to 1Meg myself...
As far as I can tell from what my French friends tell me, it has disappeared
from supermarket shelves years ago there too.
I remember seeing a one-page article in Byte a long time ago, about the Falcon,
(that was before the QuadraAVs were released) and then nothing.
A sad death for a machine which never lived up to the potential of
its really great hardware, plagued by a tremendously bad O.S.
Can you still find software and games? Did they improve the TOS at last?
Is Dave Small still making his incredibly fantastic Mac emulator?
Please let me know!

Yes, I have actually. What I am saying is that if Atari gave up on
computers last year then that would be around 6 months after the launch
of the Falcon (here in the UK), then I doubt they would have bothered
making them in the first place.

Also I doubt they would be stupid enough to build thousands of Falcons
in one huge batch and hope to sell them ASAP.

New falcon models?

New hardware for falcon?

Major updates to OS?

Advertising and promotion?

Software developement?

Heavy distribution efforts?

ALL of the above have been conspicuous by their absence. Atari seem to
have _completely_ abandoned the Atari home computer line.

I remember at the start they did try to sell the Falcon and boasted of
having such and such in developement for it, but now - nothing.

Even if Atari manage to make a sucess of the Jaguar (knowing Atari,
thats unlikely) and decide to go back into computing the resultant
model would be nothing like the Falcon we know today.

The Falcon is an end-of-line machine. The Amiga could well be in the
same position IF nothing is done. At least it has more owners and support
is better.

> Also I doubt they would be stupid enough to build thousands of Falcons
> in one huge batch and hope to sell them ASAP.

I don't doubt Atari's stupidity in the least.

^^^^^^^^^^^^^

Filemaker Pro is one of the most dodgy bug ridden databases I've ever seen.

Easy to use, but very unstable.

Just like the Mac in fact.

FMP dodgy and bug ridden. I have never heard those words used to describe it. Of course I am not that experienced with DB's though. I mean I have written about 20 in FMP, 2 in FoxBase, 6 in NuBase, and am writing one in Approach. So far the worst has been Fox, then NuBase, and Approach and FMP are the most stable. The Macs I use are very stable (much more so than Windows). Just so I don't get stupid mail I use Amigas, Macs, and Windows. I doubt you can convince that anyone of them is a horrable system except maybe Windows.

Okay, with alot of people wondering what GX is good for, IO decided to type.
Considering I am in the middle of a final now I will be brief (waiting to start
part 2).

GX does a number of things for you, allows you to do no chooser printer
drag and drop, and, more importantly, gives you full typographical control.
What does this mean? You get the same kerning, tracking, font adjusting, line
quality, pairs matching, leading, and all those other typographical wonder toys
that normally page layout (PageMaker, QaurkXpress) support on their own. This
is of very little use, really, in the above scenario; however, it can be of use
if you wish to move away from word processor only output.

Unfortunately, very few applications support, it, but it promises to be
a ground breaking technology. Applications that do, can eliminate the HUGE
amountsof code they now use to support these features and allow the OS to
handle this. Full platform wide support (expect this to be the rule under
Copeland, same and AppleScript, why? cause apple wants a retunr on their R&D
buck, that's why :)

Anyways, there is an awesome article on GX in the latest MacUSER, and
gives you a rundown of why people arevery excited about this techonology.
Apple is an industry leader by far (to my knowledge, no other machine onthe
planet support this OS wide), and look for MS to release its own version, but,
alas, only compatible w/ TT fonts (at last report). In short, if you are
notdoing DTP, likely not going to seethe advantages as much. However, if you
areyou will,as people rush to includeit in their featurelist (and offload the
development costs of such stuff to apple) Note, more features exist then I can
possiblely explain here (or have time to type :)

Want more info? I will post AFTER my exam, just ask :)

-Scott, off for part 2 of 2

Anthony, you don't seem to understand. ATARI when they said PC business,
they meant *their* computer business. That's the TT and Falcon. How can
you order one? Have you heard of stockpiling before?

ATARI was even out of the clone business before 1993.

According to Bob Brodie, Falcons were still being manufactured in
early 1994 because there was sufficient demand for the machine in the
MIDI market. CUBASE Audio helped.

Apple's PC's Top Shipments

By Bloomberg Business News

San Jose, Calif., Nov 14--
Apple Computer, Inc topped the Compaq Computer Corporation for third-quarter shipments of personal computers in the United States, the global market research company Dataquest Inc. said today.

Apple shipped more the 600,000 PC's, the most in what Dataquest said was the largest quarter ever for the United States PC market. Apple's Power
^^^^^^^^^^^^^
Mac, representing 25 percent of Apple's total shipping volmume, is on
^^^
pace to surpass the company's projected shipment of one million units by
^^
March.
^^^^^^

While Compaq fell behind Apple by about 30,000 PC shipments for the quarter, Compaq still leads in year-to-date shipments with more that 13 percent of the market compared with Apple's share of nearly 12 percent.

Dataquest said the United States PC market has grown 34 percent over the corresponding quarter a year ago, as vendors stock up with high expectations for holiday season demand as well as steady business demand.

Just thought I'd beat Sinclap to the punch. :-)

Now on to more important things, like do you think the Jag will take off this Christmas?

The current ones will not be obsolete when the PCI macs shipped. For those who need PCI, Apple will have upgrade boards. Mac 605, 475,575 can have a $550 PowerPC board installed. Can Amiga 500 be upgraded to a A1200 and the A3000 to A4000? Can an ST be upgraded to a Falcon? Can a 486 be upgraded to a Pentimun? The answer is NO!

I am going to order a LC520 with cdrom for $999 from Apple and will have a PCI upgrade next year. Just slide out the old mother board like a cooky tray and slide in the new one..Pretty neat, eh..

-Peter

I did NOT.. I repeat DID NOT bash my former employer. What I was trying to
do was convince someone who posted that there was going to be a PowerPC
based Falcon that it wasn't going to happen.

I was also trying to convince others that while the Atari ST is a great
machine,
its dated. It doesn't compete with the rest of the computing world anymore.
However, that doesn't mean that it isn't a good machine. Its a great machine.
If you enjoy using them, then please.. continue using them. But, don't expect
Atari to put out anymore machines.

They have said publicly that they have taken write-downs on their PC side of

[38 lines remaining, press RETURN for more...]

the business (that means the personal computer, not IBM PC business) and
they have discontinued it. That means that you probably will never see another
improved ST from Atari again. (That doesn't mean that someone else like the
Magic folks or the various groups in Germany that are working on improvements
won't continue.. In fact, I think there is a good market for them)

My point was simple: Atari is out of the computer business. Atari ST products are dated. If you enjoy using them, continue using them. Just don't expect Atari Corp. to provide you with that PowerPC Falcon you dreamed of. It isn't going to happen.

(The whole reason I posted in the first place is that I wanted to stop someone who was hoping for something that isn't going to happen. I hate to see people waiting for products which are never going to be developed. I would rather see that person take their money and buy a ST-clone from one of the German groups or a Mac or (shudder!) a PC. At least then they have something they can use and enjoy now. I hate to see people waste their time waiting for rumors

[21 lines remaining, press RETURN for more...]

News>
comp.sys.atari.st article 98074 of [91991,98098] (5974

that aren't true)

Anyway, I guess I am sorry I ever spoke up.

On a different note: While I didn't agree with everything that Atari Corp. did during my time there (in fact, I disagreed with lots of stuff and spoke my mind)
I do appreicate all that they did for me and I think they have a hell of a product
in Jaguar. The games are starting to roll in now and they look hot. I saw AvsP ads on TV last night, everyone is talking about them. Not to even mention the amazing deal they pulled with Sega. I really feel pretty good about Atari as a company. They still have a long way to go, but I feel pretty confident that Sam will lead them to success in that tough market. So, please.. don't misinterpret my comments about the ST being outdated with comments about Atari. I
like Atari, I have friends there and I wish them all the success in the world.

Sam or Jack Tramiel to give the official position on computer production. The employee you sited is NO LONGER WITH ATARI. While I don't think that Atari will be re-entering anytime soon, anything is possible. Remember something ... in 1985, many Atari-ites swore that Atari wouldn't re-enter the video game market. In 1994, it's their main focus.

I would also like to see a third Atari employee (one who is still with Atari) comment on the issue. Given that your source is no longer with Atari and neither is Bob Brodie ... both are lacking in the latest information. Not to mention that they provide CONFLICTING reports. In addition, I will tell you that Atari sent me a Falcon flyer last April, so there was still some interest in selling the Jag.

Hi. A lot of you go home for Thanksgiving and then have a break until January. I ask that before you go home, capture the following Jaguar Letter Writing Campaign text-file and print it out.

Do the writing on the airplane or whatever. Just take the time to write.

Thank you everyone and HAPPY THANKSGIVING!

The text-file will be called: Jaguar NOVEMBER Letter Writing Campaign.

4807. Jaguar NOVEMBER Letter Writing Campaign

Newsgroup: comp.sys.atari.advocacy
Date: 1994-11-23 05:46:10 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <3aukv2$22o@usenet.INS.CWRU.Edu>
Source record: 14602
Cross-posted to: rec.games.video.atari,rec.games.video.misc,comp.sys.atari.st,comp.sys.atari.advocacy

The following text-file is the NOVEMBER part of the 1994 Jaguar Letter Writing Campaign.

Some of you may think this is a waste of time because you think that companies aren't listening to what you have to say. If you feel this way, you are wrong. This is the ONLY way to let companies know that you want their games on the Jaguar 64-bit interactive multimedia system.

I don't know if many of you realize this or not, but since this campaign has taken place, things have been happening. One of the first companies that we have written was WMS Industries (Williams). Atari and Williams have made an agreement to make Defender, Joust, and Robotron for the Jaguar. These were some of the best games in the past and they will no doubt be hits in their new 3-D form.

Another company that we have written to thank for doing a great job with Wolfenstein 3-D and to encourage the company to do a great job with Jaguar DOOM is id Software. Do programmers work EXTRA hard knowing that people appreciate their work? Jaguar DOOM is getting incredible reviews and I wouldn't be surprised if our letters helped make it that good.

We are now hearing rumors about Mortal Kombat II for the Jaguar. Some people have claimed to know people that have actually played it on the Jaguar. Atari Corp. won't confirm it, but it is possible that all of the letters that we have written to get Mortal Kombat II for the Jaguar is actually working.

If we haven't actually seen results YET with all of the other letters we have written doesn't mean our letters aren't working. Letters from consumers asking for a company's product can really work on an executive's brain. If he has some extra capital coming up in the future and has to make a decision what to do with the capital, your letters will influence his or her decision. FACT: Letters make a difference.

And your letters are EXTREMELY important NOW. This is because it takes about ten months to make a game and get it to market. If companies sign to make games for the Jaguar now, we will all be playing that game by Christmas of 1995.

I also don't know if you all realize this or not, but a few minutes of your time now can result in Atari being around years from now. If these incredible games are available for the Jaguar by this time next year, the Jaguar will be the #1 selling game system in 1995. And if the Jaguar is the #1 selling system next year, Atari will be around for a long time.

But don't do it for Atari. Do it for yourself. Most of us kept posting messages to Usenet for the last few years when Lynx games were slow in coming.

We -never- wrote game companies asking them to make games for the Lynx.
The result was that not enough games were made for the Lynx and the Lynx didn't
take off like it should have. We now criticize Atari for the failure of
the Lynx just like we will be doing two years from now about the Jaguar IF
we do not write game companies now.

I urge you to write. The time is now. Don't think other people will write
because they won't. You have to take a few minutes from your already busy
life and write these letters. Yes, it is a pain. But it is something that
must be done.

Thank you. The following is the NOVEMBER portion of the 1994 Jaguar Letter
Writing Campaign. I will post the complete campaign in the next message.

Len Stys, 1994 Jaguar Letter Writing Campaign Organizer

****
********** NOVEMBER, 1994 **********
****

Virgin Games
Spectrum Holobyte
Psygnosis
Origin Systems

>>>>>>>>>>>>>>>>>>>>>>>>>> Virgin Games <<<<<<<<<<<<<<<<<<<<<<<<<<

Virgin Games is already a Jaguar developer, so this letter is mainly to
thank the company and to encourage them to make more titles for the Jaguar.
Virgin is suppose to be making Cannon Fodder, Demolition Man, and
Dragon for the Jaguar. The company is also planning to make a CD-ROM game
called Creature Shock for the Jaguar.

Virgin Games is known for making a popular PC CD-ROM game called:
The 7th Guest. It has also made Land of Lore, Dune II, and
Indy Car Racing. It will also be releasing 11th Hour and Command & Conquer
for the PC soon.

The mailing address for Virgin Games is:

Virgin Games
18061 Fitch Avenue
Irvine, CA 92714

The following is a list of things in which you may want to say in your
letter to Virgin Games:

Dear Sir or Madam,

1) How you enjoy Virgin Games' games.
2) How much you enjoy the Atari Jaguar.
3) How you are really happy that Virgin Games is making games for the
Jaguar.

4) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
5) How you would like to see other popular games such as The 7th Guest
(and name a few) besides the ones the company is already making
for the Jaguar.
6) How you would like to see the Jaguar modem and network features used
in Virgin Games' software (OPTIONAL).
7) How you will run out and buy Virgin Games' games when they are
produced for the Jaguar.
8) Thank you to the person for reading your letter and for producing
games for the Jaguar.

You may also want to FAX Virgin Games by the phone number: 714/833-8717.

>>>>>>>>>>>>>>>>>>>>>>> Spectrum Holobyte <<<<<<<<<<<<<<<<<<<<<<<

Spectrum Holobyte is famous for their Falcon flight simulator game.
The game can even be played through the modem on PCs. Spectrum Holobyte
has just released Fields of Glory and is rumored to be working on
Falcon 4.0.

Modem games is something that a game system must have if it will be
successful in the future. And Spectrum Holobyte is well-known for their
modem games. Falcon 4.0 sounds like it would be perfect for the
Jaguar.

The mailing address for Spectrum Holobyte is:

Barry J. Folsom, President
Spectrum Holobyte
2490 Mariners Square Loop
Alameda, CA 94501

The following is a list of things in which you may want to say in your
letter to Spectrum Holobyte:

Dear Mr. Folsom,

1) How much you enjoy Spectrum Holobyte games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) How you would like to see Falcon 4.0 with voice-modem and networking
capabilities on the Jaguar.
5) How you would like to see Fields of Glory and other Spectrum Holobyte
games for the Jaguar.
6) How you believe Spectrum Holobyte games will be unbelievable when
using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Spectrum Holobyte games when they are
produced for the Jaguar.
8) Thank Mr. Folsom for reading your letter and for considering
producing games for the Jaguar.

You may also want to FAX Spectrum Holobyte by the phone number:
510/522-2138. But please keep in mind that sending a letter through
the U.S. Postal Service may be more effective.

>>>>>>>>>>>>>>>>>>>>>>>>>> Psygnosis <<<<<<<<<<<<<<<<<<<<<<<<<<

Psygnosis is a well known producer of video games. A few of Psygnosis'
popular games are Microcosm, Shadow of the Best II, and Puggsy. A recent
game is Hexx: Heresy of the Wizard. TThe company has also done Lemmings.

The mailing address for Psygnosis is:

Psygnosis
675 Massachusetts Ave.
Cambridge, MA 02139

The following is a list of things in which you may want to say in your
letter to Psygnosis:

Dear Sir or Madam,

1) How much you enjoy Psygnosis games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple
of Pysgnosis games).
5) How you believe Psygnosis games will be unbelievable when using the
graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Psygnosis games when they are produced
for the Jaguar.
7) Thank the person for reading your letter and for considering producing
games for the Jaguar.

You may also want to FAX Psygnosis by the phone number: 617/497-6759.

>>>>>>>>>>>>>>>>>>>>>>>>>> Origin Systems <<<<<<<<<<<<<<<<<<<<<<<<<<

Origin Systems is a maker of many popular PC role-playing and action games.
The company is owned by Electronic Arts but may have freedom to develop
for any system it wishes. Some of the games that Origin makes are:
Ultima series (most recently Ultima VIII: Pagan), Wing Commander Privateer,
and just recently Pacific Strike. Origin will be also making Biforge
and Wings of Glory.

Since Origin Systems is a subsidary of Electronic Arts, there is no
specific person to write.

The mailing address for Origin Systems is:

Origin Systems
Attn: Production Teams
P.O. Box 161750

Austin, TX 78716

The following is a list of things in which you may want to say in your letter to Origin Systems:

Dear Sir or Madam,

1) How much you enjoy Origin Systems games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or three Origin Systems games).
5) How you wish the Origin Systems Production Teams will attempt to get these great games on the Jaguar.
6) How unbelievable Origin Systems games will be when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Origin Systems games when they are produced for the Jaguar.
8) A thank you to the person reading for reading your letter and for considering producing games for the Jaguar.

********** THANK YOU! **********

4808. 1994 Jaguar Letter Writing Campaign (complete text-file)

Newsgroup: comp.sys.atari.advocacy
Date: 1994-11-23 05:55:06 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <3aulg0$2hd@usenet.INS.CWRU.Edu>
Source record: 14604
Cross-posted to: rec.games.video.atari,rec.games.video.misc,comp.sys.atari.st,comp.sys.atari.advocacy

The following is the complete 1994 Jaguar Letter Writing Campaign text-file. If you haven't participated in these campaigns, but wish to participate now, you are encouarged to go through past months and write each company mentioned a letter.

One letter you may wish to write is to Atari Corporation. It is good to let Atari know that we are participating in these campaigns so they can take steps to get these companies developing for the Jaguar.

Letters do work. But they only work if you write them and send them! Do your part so that we can be playing some GREAT Jaguar games in the coming years! Thank you!

****
********** SEPTEMBER, 1994 **********
****

Atari Corp.
id Software
WMS Industries Inc.
Capcom USA Inc.
Electronic Arts Inc.

>>>>>>>>>>>>>>>>>>>>>>>> Atari Corp. <<<<<<<<<<<<<<<<<<<<<<<<<<

First, we will first be writing Don Thomas, Jr. at Atari Corp. to let him know that we are participating in these campaigns. No, we aren't writing to annoy him. We are writing him so that Atari Corp. knows the magnitude of this letter writing campaign. If Atari Corp. knows that five-hundred people will be writing Dynamix in October, the appropriate person at Atari can contact this company on becoming a developer for the Jaguar during this time. Do not expect a letter from Don Thomas, Jr. We are not writing him for a response. We are only writing him to inform him of what we are doing.

Atari's mailing address is:

Atari Corp.
Attn: Don Thomas, Jr.
1196 Borregas Avenue
Sunnyvale, CA 94089

Place the letters: C.A.I.N. at the bottom left side of the envelope so that Atari will know what it is for.

Please use the following form letter:

(date)

(your address)

Don Thomas, Jr.
Atari Corporation
1196 Borregas Avenue
Sunnyvale, CA 94089

Dear Mr. Thomas,

I am writing you to inform you that I will be writing the following
game companies to encourage them to make games for the Jaguar.
I hope that my efforts will help Atari Corp. to sign these companies
to make games for the Jaguar.

The companies I will be writing are:

September: WMS Industries, Capcom, Electronic Arts
October: Sierra On-Line, Dynamix, LucasArts, NovaLogic
November: Spectrum Holobyte, Psygnosis, Origin
December: QQP, Broderbund, Konami

Thank you for reading my letter and for recording the number of
people writing these companies.

Sincerely,

(sign your name)

(print your name)

>>>>>>>>>>>>>>>>>>>>>>>>>> id Software <<<<<<<<<<<<<<<<<<<<<<<<<<

The letter to id Software should thank the company for producing
Wolfenstein 3-D for the Jaguar, encourage them to make Jaguar DOOM the
best that they can make it, and to encourage the company to make
QUAKE for the Jaguar.

id Software's e-mailing address:

Jay Wilbur, CEO
id Software
Town East Tower
18601 LBJ Freeway
Suite 615
Mesquite, Texas 75150

The form letter to Atari Corp. is the only form letter that will be used
in this campaign. This is because companies do not take form letters as
seriously as those that are originally written.

The following is a list of things which you may want to say in your
letter to id Software:

Dear Mr. Wilbur,

1) How much you enjoy Jaguar Wolfenstein 3-D.
2) How much you like id Software.
3) Thanks for making Wolfenstein 3-D for the Jaguar.
4) How you would like to see the best graphics possible for DOOM
on the Jaguar.
5) How you would like to see four-player or more networking capability
for Jaguar DOOM.
6) How you are excited about Jaguar DOOM coming out this year.
7) How you would like to see QUAKE made for the Jaguar.
8) Thank you to Mr. Wilbur for reading your letter.

Another thing which you may want to include in this letter is concerning the Jaguar resolutions. id Software is using a lower resolution on the Jaguar because they want to get the game as quick as Jaguar Wolfenstein. I, personally, do not care if Jaguar DOOM is as fast as Wolfenstein. One suggestion could be to make two modes (just like on the PC). One mode is for higher resolution and slower speed. The other mode is for a lower resolution, but higher speed.

>>>>>>>>>>>>>>>>>>>>>> WMS Industries Inc. <<<<<<<<<<<<<<<<<<<<<<

As of September 14, 1994, Mortal Kombat II is not being produced for the Jaguar. And Acclaim has no plans to produce Mortal Kombat for the Jaguar. But next year, WMS Industries will be able to release Mortal Kombat II for any game system that the company wishes to release it for. The time is now to let WMS Industries know that we want to see Mortal Kombat II and Mortal Kombat III for the Jaguar.

Mortal Kombat II is by far the #1 most wanted game for the Jaguar according to the Most Wanted Games for the Jaguar list by CAIN Newsletter. If this game is released for the Jaguar, the Jaguar will be the most wanted game system.

The mailing address of WMS Industries Inc. is:

Louis J. Nicastro, CEO
WMS Industries Inc.
3401 North California Ave.
Chicago, IL 60618-5889

OK. I don't think I have to remind you that you should write as neat and as professional as possible to get the best results. If you certify your letter, you may even reach the president with your letter.

The following is a list of things in which you may want to say in your letter to WMS Industries Inc.:

Dear Mr. Nicastro,

1) How much you enjoy Mortal Kombat II
2) How you like the games that WMS Industries makes.
3) How you enjoy the Atari Jaguar.

4) How you think the Atari Jaguar is the only game system that will do
the game justice.
5) How you will run out and get the game for the Jaguar as soon as it
is released.
6) How you would also like to see Jaguar be the first system to get
Mortal Kombat III.
7) Thank you to Mr. Nicastro for reading your letter and for considering
making Moral Kombat II for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>> Capcom USA INC. <<<<<<<<<<<<<<<<<<<<<<<

Capcom is known for producing the Street Fighter II series of games.
The company is also known for producing games such as The Great Circus
Mystery Starring Mickey & Minnie Mouse, Demon's Crest, and Saturday
Night Slam Masters. The company also does conversions of popular titles
such as Wizardry V and Eye of the Beholder.

Super Street Fighter II Turbo is second only to Mortal Kombat II on the
most wanted games for the Jaguar CAIN Newsletter listing. If the game
existed for the Jaguar, it would no doubt sell a lot of Jaguars. But
Capcom is not making Super Street Fighter for the Jaguar and no plans have
been announced to do so in the near future.

The strange thing is that Capcom is making Super Street Fighter II Turbo
for the 3DO platform. The game will even have better graphics than that
on the SNES and Genesis. But this only means that if Capcom will make a
version of SSFIIT for a much higher-priced system than there is a chance
that the company will be willing to make a Jaguar version.

The mailing address for Capcom USA Inc. is:

Scott Smith
Product-Development Coordinator
Capcom USA Inc.
475 Oakmead Parkway
Sunnyvale, CA 94086

The following is a list of things in which you may want to say in your
letter to Capcom USA Inc.:

Mr. Smith,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do
the game justice.
5) How you will run out and get Super Street Fighter II Turbo for the
Jaguar as soon as it is released.
6) Thank you to Mr. Smith for reading your letter and for considering
making Super Street Fighter II Turbo for the Jaguar.

You may also want to FAX Capcom USA by the phone number: 408/774-3995. But sending mail through the U.S. Postal Service may prove to be more successful.

>>>>>>>>>>>>>>>>>>>> Electronic Arts Inc. <<<<<<<<<<<<<<<<<<<<

Electronic Arts is the publisher of some incredible games such as: NBA Showdown, FIFA International Soccer, PGA European Tour Golf, NHL Hockey '94, Wing Commander, Super Wing Commander, John Madden NFL Football, Escape from Monster Manner, Twisted, Mario Andretti Racing, MLBPA Baseball, and many more! Electronic Arts also owns several other software companies that they may give the OK to develop the Jaguar for if they see there is a demand for Jaguar games.

Unfortunately, Electronic Arts is also a major backer of 3DO, a company that is a big competitor of Atari Corp. Electronic Arts is spending a lot of time and money on making games for 3DO that it could be spending on the Jaguar.

There is hope though! Electronic Arts is a licensee. This means that the company has Jaguar developers units. Electronic Arts' management just has to give the OK to make games for the Jaguar.

The mailing address for Electronic Arts Inc. is:

Lawrence F. Probst III, President
Electronic Arts Inc.
1450 Fashion Isle. Blv.
San Mateo, CA 94404

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Probst,

1) How much you enjoy Electronic Arts games.
2) How you have been buying Electronic Arts games for your computers since the company was started (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) The games that you would love to slee on the Jaguar (choose two or three Electronic Arts games--I'm choosing John Madden NFL Football!).
6) How you believe Electronic Arts games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Electronic Arts' games when they are produced for the Jaguar.
8) Thank you to Mr. Probst for reading your letter and a thank you for considering producing games for the Jaguar.

****
****************************** OCTOBER, 1994 ******************************
****

Sierra On-Line Inc.
Dynamix Inc.
LucasArts Entertainment Co.
NovaLogic

>>>>>>>>>>>>>>>>>>>>>>>> Sierra On-Line Inc. <<<<<<<<<<<<<<<<<<<<<<<<

Sierra On-Line is a company that is well-known for their role-playing games such as their Space Quest and Police Quest series. The company is also known for their latest hits in the PC world: Gabriel Knight, Aces Over Europe, and Leisure Suit Larry VI. Sierra On-Line is planning to release their new title, Phantasmagoria, very soon.

Sierra On-Line is definitely a company that needs to be developing for the Jaguar if the Jaguar CD-ROM is to become used. If Sierra On-Line starts making games for the Jaguar CD-ROM, several other companies will make games for it as well.

The mailing address for Sierra On-Line is:

Kenneth A. Williams, President
Sierra On-Line Inc.
P.O. Box 485
Coarsegold, CA 93614

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Williams,

1) How much you enjoy Sierra On-Line games.
2) How you have been buying Sierra On-Line games for your computer since the company started making computer games (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see Sierra On-Line producing several Jaguar CD-ROM games.
6) The games you would love to see on the Jaguar (choose two or three Sierra On-Line games).
7) How you believe Sierra On-Line games would be fantastic on the Atari Jaguar.
8) How you will run out and buy Sierra On-Line games when they are made for the Jaguar.
9) Thank you to Mr. Williams for reading your letter and for considering producing games for the Jaguar.

In my letter, I will also be encouraging Mr. Williams to make games which have the option of using a keyboard with the Jaguar. A keyboard can be created for the Jaguar and Sierra On-Line could work with Atari Corp. to produce one for it. The use of a keyboard in role-playing games help children learn words. This is something that Sierra has gotten away from in PC games.

I'm also writing Sierra to release HOYLE Card Games for the Jaguar.
I love this game and it would be great to see a modem feature being used
in the Jaguar version of this game.

>>>>>>>>>>>>>>>>>>>>>>>>>> Dynamix Inc. <<<<<<<<<<<<<<<<<<<<<<<<<<

Dynamix Inc. is a game company owned by Sierra On-Line. This game
company makes many wonderful titles for the PC such as: Betrayal at
Kronder, Aces of the Pacific, and Front Page Sports Football Pro.
The company is planning to release: Front Page Baseball, Battledrome,
LodeRunner: A Legend, MetalTech: Earth Siege, Alien Legacy, and an
excellent reviewed game called Aces of the Deep (submarine game).

Dynamix Inc. is making some real great games and these games would be
a very good addition to the present Jaguar game library.

The mailing address for Dynamix Inc. is:

Alan Higginson
Executive Vice-President
Dynamix Inc.
P.O. Box 978
Oakhurst, CA 93644-0978

The following is a list of things in which you may want to say in your
letter to Dynamix Inc.:

Dear Mr. Higginson,

1) How you enjoy Dynamix games on the PC.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or
three Dynamix games--I'm choosing Front Page Sports Football,
Alien Legacy, and Aces of the Deep).
5) How you believe Dynamix games will be unbelievable when using the
graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Dynamix games when they are produced
for the Jaguar.
7) Thank you to the person for reading your letter and for considering
producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>> LucasArts Entertainment Co. <<<<<<<<<<<<<<<<<<

LucasArts is famous for making games based on popular movies. The company
has also has several popular titles out for the PC. Some of these titles
are: Star Wars Rebel Assault, X-Wing, Indiana Jones and the Fate of
Atlantis, Monkey Island 2: Le chuck's Revenge, and Day of the Tentacle.
And if there is any truth to the rumor of a new Indiana Jones movie,
LucasArts will probably make a great game based on this movie.

The mailing address for LucasArts is:

LucasArts Entertainment Co.
LucasArts Games Division
P.O. Box 10307
San Rafael, CA 94912

The following is a list of things in which you may want to say in your letter to LucasArts:

Dear Sir or Madam,

1) How much you enjoy LucasArts games.
2) How much you enjoy the Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games you would love to see on the Jaguar (choose two or three LucasArts games).
5) How you believe LucasArts games would be fantastic on the Atari Jaguar.
6) How you will run out and buy LucasArts games when they are made for the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX LucasArts by the phone number: 415/721-3344.

>>>>>>>>>>>>>>>>>>>>>>>>>>>> NovaLogic <<<<<<<<<<<<<<<<<<<<<<<<<<<<

NovaLogic is known for its high-quality games on the PC. The president and CEO, John Garcia makes sure each game title released is of the highest quality. NovaLogic is known for producing Comanche: Maximum Overkill (a game title that rated high on the Most Wanted Games for the Jaguar listing from CANI Newsletter). The company also produced WolfPack (a submarine simulator) and UltraBots. The latest and greatest game from NovaLogic is Armored Fist. This game is highly praised by reviewers that have seen it.

John Garcia is interested in producing modem games and networking games in the future. NovaLogic's games would be a great addition to the Jaguar game library.

The mailing address for NovaLogic is:

John Garcia, President
NovaLogic
19510 Ventura Blvd.
Suite 200
Tarzana, CA 91356

The following is a list of things in which you may want to say in your letter to NovaLogic:

Dear Mr. Garcia,

1) How much you enjoy NovaLogic games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple
of NovaLogic games).
5) How you believe that NovaLogic games will be even more fantastic when
using the graphics and sound capabilities of the Jaguar.
6) How you would like to see NovaLogic games that use the Jaguar
voice-modem and networking capabilities.
7) How you will run out and buy NovaLogic games when they are produced
for the Jaguar.
8) Thank Mr. Garcia for reading your letter and for considering producing
games for the Jaguar.

You may also want to FAX NovaLogic by the phone number: 818/774-0684.
Please consider writing NovaLogic through the U.S. mail first and then
FAX NovaLogic.

****
********** NOVEMBER, 1994 **********
****

Virgin Games
Spectrum Holobyte
Psygnosis
Origin Systems

>>>>>>>>>>>>>>>>>>>>>>>>>> Virgin Games <<<<<<<<<<<<<<<<<<<<<<<<<<

Virgin Games is already a Jaguar developer, so this letter is mainly to
thank the company and to encourage them to make more titles for the Jaguar.
Virgin is suppose to be making Cannon Fodder, Demolition Man, and
Dragon for the Jaguar. The company is also planning to make a CD-ROM game
called Creature Shock for the Jaguar.

Virgin Games is known for making a popular PC CD-ROM game called:
The 7th Guest. It has also made Land of Lore, Dune II, and
Indy Car Racing. It will also be releasing 11th Hour and Command & Conquer
for the PC soon.

The mailing address for Virgin Games is:

Virgin Games
18061 Fitch Avenue
Irvine, CA 92714

The following is a list of things in which you may want to say in your
letter to Virgin Games:

Dear Sir or Madam,

1) How you enjoy Virgin Games' games.
2) How much you enjoy the Atari Jaguar.

3) How you are really happy that Virgin Games is making games for the
Jaguar.
4) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
5) How you would like to see other popular games such as The 7th Guest
(and name a few) besides the ones the company is already making
for the Jaguar.
6) How you would like to see the Jaguar modem and network features used
in Virgin Games' software (OPTIONAL).
7) How you will run out and buy Virgin Games' games when they are
produced for the Jaguar.
8) Thank you to the person for reading your letter and for producing
games for the Jaguar.

You may also want to FAX Virgin Games by the phone number: 714/833-8717.

>>>>>>>>>>>>>>>>>>>>>>> Spectrum Holobyte <<<<<<<<<<<<<<<<<<<<<<<

Spectrum Holobyte is famous for their Falcon flight simulator game.
The game can even be played through the modem on PCs. Spectrum Holobyte
has just released Fields of Glory and is rumored to be working on
Falcon 4.0.

Modem games is something that a game system must have if it will be
successful in the future. And Spectrum Holobyte is well-known for their
modem games. Falcon 4.0 sounds like it would be perfect for the
Jaguar.

The mailing address for Spectrum Holobyte is:

Barry J. Folsom, President
Spectrum Holobyte
2490 Mariners Square Loop
Alameda, CA 94501

The following is a list of things in which you may want to say in your
letter to Spectrum Holobyte:

Dear Mr. Folsom,

1) How much you enjoy Spectrum Holobyte games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) How you would like to see Falcon 4.0 with voice-modem and networking
capabilities on the Jaguar.
5) How you would like to see Fields of Glory and other Spectrum Holobyte
games for the Jaguar.
6) How you believe Spectrum Holobyte games will be unbelievable when
using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Spectrum Holobyte games when they are
produced for the Jaguar.

8) Thank Mr. Folsom for reading your letter and for considering
producing games for the Jaguar.

You may also want to FAX Spectrum Holobyte by the phone number:
510/522-2138. But please keep in mind that sending a letter through
the U.S. Postal Service may be more effective.

>>>>>>>>>>>>>>>>>>>>>>>>>> Psygnosis <<<<<<<<<<<<<<<<<<<<<<<<<<

Psygnosis is a well known producer of video games. A few of Psygnosis'
popular games are Microcosm, Shadow of the Best II, and Puggsy. A recent
game is Hexx: Heresy of the Wizard. TThe company has also done Lemmings.

The mailing address for Psygnosis is:

Psygnosis
675 Massachusetts Ave.
Cambridge, MA 02139

The following is a list of things in which you may want to say in your
letter to Psygnosis:

Dear Sir or Madam,

1) How much you enjoy Psygnosis games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple
of Pysgnosis games).
5) How you believe Psygnosis games will be unbelievable when using the
graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Psygnosis games when they are produced
for the Jaguar.
7) Thank the person for reading your letter and for considering producing
games for the Jaguar.

You may also want to FAX Psygnosis by the phone number: 617/497-6759.

>>>>>>>>>>>>>>>>>>>>>>>>>> Origin Systems <<<<<<<<<<<<<<<<<<<<<<<<<<

Origin Systems is a maker of many popular PC role-playing and action games.
The company is owned by Electronic Arts but may have freedom to develop
for any system it wishes. Some of the games that Origin makes are:
Ultima series (most recently Ultima VIII: Pagan), Wing Commander Privateer,
and just recently Pacific Strike. Origin will be also making Biforge
and Wings of Glory.

Since Origin Systems is a subsidary of Electronic Arts, there is no
specific person to write.

The mailing address for Origin Systems is:

Origin Systems
Attn: Production Teams
P.O. Box 161750
Austin, TX 78716

The following is a list of things in which you may want to say in your
letter to Origin Systems:

Dear Sir or Madam,

1) How much you enjoy Origin Systems games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or
three Origin Systems games).
5) How you wish the Origin Systems Production Teams will attempt to get
these great games on the Jaguar.
6) How unbelievable Origin Systems games will be when using the graphics
and sound capabilities of the Jaguar.
7) How you will run out and buy Origin Systems games when they are
produced for the Jaguar.
8) A thank you to the person reading for reading your letter and for
considering producing games for the Jaguar.

****
********** DECEMBER, 1994 **********
****

QQP, Inc.
Broderbund
Konami
MicroProse

>>>>>>>>>>>>>>>>>>>>>>>>>>>> QQP, Inc <<<<<<<<<<<<<<<<<<<<<<<<<<<<

Many people are not familiar with QQP, but the company has released some
pretty amazing games for the PC. Some of the games are: Solitaire's
Journey, Merchant Prince, The Perfect General, Conquered Kingdoms, and
their most recent--Origamo.

Most of the games that QQP makes either has to do with strategy or war.
Strategy games are always popular, but war games have been restricted to
PCs due to lack of a "save game" feature on video game systems. Jaguar
can save games on its cartridges so this is no longer a problem in getting
war games to home video game systems.

The mailing address for QQP, Inc. is:

QQP, Inc.
495 Highway 202
Flemington, NJ 08822

The following is a list of things in which you may want to say in your letter to QQP:

Dear Sir or Madam,

1) How much you enjoy strategy games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you love to see on the Jaguar (choose two or three QQP games).
5) How you would like to see these games make use of Jaguar's voice-modem and networking capabilities.
6) How you believe QQP games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy QQP games when they are produced for the Jaguar.
8) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>> Broderbund Software Inc. <<<<<<<<<<<<<<<<<<<<

Broderbund Software is well-known for producing two games. The first game is a CD-ROM game called Myst. The second is the Carmen Sandiego series of games. The Carmen Sandiego is educational.

The mailing address for Broderbund Software Inc. is:

Edmund R. Auer, President
Broderbund Software Inc.
500 Redwood Blvd.
Novato, CA 94948-6121

The following is a list of things in which you may want to say in your letter to Broderbund:

Dear Mr. Auer,

1) How much you enjoy Broderbund Software's games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) How you would love to see Myst, Carmen Sandiego, and any other new Broderbund titles on the Jaguar.
5) How unbelievable Broderbund Software games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Broderbund Software's games when they are produced for the Jaguar.
7) A thank you to Mr. Auer for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>>>>> Konami Inc. <<<<<<<<<<<<<<<<<<<<<<<<<<<

Konami makes several popular games. Among these are Double Dribble: The Playoff Edition, Lethal Enforcers 2, Batman the Animated Series, and a new game called Contra 4. The company has also made Rocket Knight Adventures, Teenage Mutant Ninja Turtles Tournament Fighters, Blades of Steel, Track & Field II, Top Gun: The Second Mission, and many others. Konami is also rumored to be developing Gradius for Sony's new PSX. Since Konami is already developing for other next generation systems, it may be more difficult to convince them to make games for the Jaguar. But Konami certainly does bring a lot of titles to a game system.

The mailing address of Konami is:

Konami Inc.
900 Deerfield Parkway
Buffalo Grove, IL 60089-4510

The folowing is a list of things in which you may want to say in your letter to Konami:

Dear Sir or Madam,

1) How much you enjoy Konami games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a few Konami games).
5) How unbelievable Konami games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Konami games when they are produced for the Jaguar.
7) A thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>> MicroProse Inc. <<<<<<<<<<<<<<<<<<<<<<<<

MicroProse is already developing Jaguar games so this letter will be mainly to thank MicroProse and encourage the company to make more of their games for the Jaguar. MicroProse is supposedly making Grand Prix, Gunship 2000, and possibly Star Trek: The Next Generation game. But MicroProse has made a lot of fantastic games for the PC that should really be made for the Jaguar. These include: World Circuit, Fleet Defender, Master of Orion, and Civilization. Civilization has already been made for the Falcon030 so it may not be too hard to convert the game to the Jaguar. Since Jaguar can save games on cartridge, it may be possible to make Civilization on the Jaguar. MicroProse is also making Across the Rhine, Colonization, and Masters of Magic.

MicroProse is indeed a very good company to have making Jaguar games. The quality has always been good and it would be nice for the company to make a lot of their games for the Jaguar.

The mailing address for MicroProse is:

Ronald J. Bueche, CEO
MicroProse Inc.
180 Lakefront Dr.
Hunt Valley, MD 21030-2245

The following is a list of things in which you may want to say in your letter to MicroProse:

Dear Mr. Bueche,

1) How much you enjoy MicroProse games.
2) How much you enjoy your Atari Jaguar.
3) How you are really glad that MicroProse is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games besides Gunship 2000 and Grand Prix be made for the Jaguar (name a few of your favorite MicroProse games).
6) How you would like to see the Jaguar voice modem and network capabilities used in MicroProse games. (OPTIONAL)
7) How you will run out and buy MicroProse games when they are produced for the Jaguar.
8) Thank you to Mr. Bueche for reading your letter and for making games for the Jaguar.

You may also want to FAX MicroProse at the phone number: 410/771-1174. But only FAX MicroProse if you do not have time to mail the letter or if you have already sent mail to the company.

****
* *
********** LETTER WRITING CAMPAIGN FINISHED **********
* *
****

After you have done writing all of these companies, the letter writing campaign will be finished. If you have written all of these companies, the campaign will no doubt be successful and we will be seeing the games we want for the Jaguar very soon.

Please spread the word around about this letter writing campaign on online systems, BBSs, message areas, user groups, and any other place that you can help get the word out abuot this campaign.

Also, please tell your friends! It is very important to get everyone participating in this letter writing campaign!

********** THANK YOU! **********

I agree to your posting except for two things:

> Since I got tired of waiting for a TT and bought a PC clone, I never
> owned one. However, I was glad that I didn't after finding out that the
> TT wasn't even fully compatible with the ST. Could there be anything
> WORSE than that?

Oh yes: That is delaying the machine until it is out of date.
That's what happened. I have both a TT and ST, and I didn't
have many problems with compatibility except for the first
few weeks (I bought this machines as a developer, i.e. very
early.) I don't think compatibility has been a big issue for
the main productivity applications. Quite a few utilities crashed,
but that's because the Atari market was/is full of hobbyists,
and you can't expect ultraclean programming in such a
non-professional environment.

> The TT and Falcon were overpriced and outdated at introduction. How can
> anyone be excited about a computer company in the mid-90's whose flagship
> machine is a 16Mhz 68030 - and it won't even run software from the 8Mhz
> 68000?

Speed actually was the reason why I didn't buy a Falcon. I'm
too much used to the speed my TT gives me. On the other hand,
with a 32 MHz CPU the Falcon would have been a very fine machine
even for its time.

> The ironic thing is, Atari has had some of the most loyal followers in
> the industry.

Yeah, I also wonder about that from time to time. Maybe it has
even contributed to Atari's failure. A loyal following will
probably fail to give honest feedback to new products.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^
>Pentium? The answer is NO!
^^^^^^^^^^
Oh yes it can, there are two upgrade paths of which one is currently available
the first is to do what you describe below and replace the motherboard, the
second is available from Q1/Q2 next year and allows you to just replace the
main processor, which is kept in a ZIF socket.
>
>I am going to order a LC520 with cdrom for $999 from Apple and will have a PCI

Not, really, you're effectively replacing one computer with another, it is
generally accepted that when it is time for the motherboard to go it is usually
time for the whole machine to go/be recycled within your firm.

Anyway, I thought you were unemployed now so how are you going to afford
all of this?

Barry.

Yes, but what else can you really do on an Amiga?
I mean are there many productivity type things out there? I considered an Amiga once but was not real impressed
with what was out there (besides games of course. The Amiga rocks for this!)

Funny vapourware this CD-Rom, considering they've shown it at various
computer trade shows already and have software developed for it.

On the contrary, I beleive that St/Falcon software incompatiblity is
much higher than A500/A1200 incompatibility.

Thats why you have continuing releases of Backwards and Magic. With the
Amiga only really old software shows big problems and even then the
built in ECS/OCS emulation mode can help a lot. Since the A1200 came out
two years ago, ALL regular Amiga software runs on it. And unlike the Atari,
there has been a LOT of new software in those two years.

THere were people on this group in APRIL who claimed the CDROM was going
to be out mid-94 and was 'ready for release'. I and others got flamed for
pointing out that it could be a _long_ time before Jaguar owners got to
see it. With so few carts for existing systems, it'd be pretty stupid to
introduce a new format for Jaguar.

: Sorry, I would have to disagree. I love my Amiga at home, and I work on Macs
: all day. I have grown to accept the limitations of both machines. Recently
: though, I saw some very smooth, full screen animations on a Mac using a
: PPC 8100/110. It also had no problems playing fairly large (~1/6) quicktimeVR
: screens (These I might add were really cool). So basically what I am saying
: is that I have never seen a better movie (sound and graphics) than the
: quicktime movies that I saw running (ofcourse a PPC 8100/110 isn't exactly
: a slow computer).

: Later,
: Rob Morton
: morton@wam.umd.edu

So what resolution and amoiunt of colrs was it running, quite frankly no gives
a rats ass about 256 colors anymoreb?RH. The A4000 can do 18bit and sound at 30
frames per second. Can the PPC output to tape at a reasonable quality? For
animators the A4000 has a nice sweet of software with some of the best 3-d
programs around. All in all the A4000 is an inexpensive way to get a video
production suite. The MAC is not.

But while we are on the topic of MACS, I think the MAC has a lot going for it,
interface and OS wise. There are some things that are lacking, but that is the
same on all platforms. I personally emulate the MAC on my Amiga, and video for
it is quite quick, well at least fairly quick (I don't havea top of the line
gfx board).

-Wight Wolfe-

BTW: What can't be done natively can be done in emulation, the mac does this, and so do I. My computer runs all of my favorite apps.

Against WHAT???

If there were some competition it might have been interesting, but...

let's see here... first we have the PC:s

486:ers - WOW!! At last, a computer that boots my Graphics environment in
less than a minute (And that's after the OS is loaded!!)

Mac:ers - WOW!! I've got color graphics!! I've got sound!! I just wonder
when Apple is going to hack together an OS that's good enough to
use it

Amigers - WOW!! I've got some graphics at last!! Wonder what this HAM-thing
is anyway?? No doubt something that goes on your sandwich!!
Commodore managed to make several models of Amiga before their
death, but they couldn't get it to sound better than this!!??
Nice going!! (BTW memory is not the problem!! I use 8-bit samples
myself, but not linear!! Sound's great!!)

FLAME ME IF YOU LIKE!! (but try to keep it in the news department!!)

Stefan

G MORAN (moran@dace.bnr.co.uk) wrote:
: New falcon models?

Wait and see, German CeBit 95 show.

: New hardware for falcon?

Enough, we have digitisers, scanners, printers, monitors, we don't need
samplers, there are pieces of MIDI hardware galore, heck even Titan are
working on a Genlock.

: Major updates to OS?

TOS 5 you mean?

: Advertising and promotion?

Have they _ever_ done that? And besides Silica advertise and promote the
Atari pretty well.

: Software developement?

Apex Media out this month, lots of new games now available from 16/32,
Speedo GDOS upgraded again. It's all out there, but you don't look for
it because you never need to.

: Heavy distribution efforts?

Gasteiner, Compo, Silica, First Computer Centres, Camrbridge Business
Solutions. If you want to buy one you can.

: ALL of the above have been conspicuous by their absence. Atari seem to
: have _completely_ abandoned the Atari home computer line.

They might have, but plenty of people havn't (and I mean 3rd party
companies, the sort that have kept both the Atari and Amiga world alive
for a lot longer than they should have).

: Even if Atari manage to make a sucess of the Jaguar (knowing Atari,
: thats unlikely) and decide to go back into computing the resultant
: model would be nothing like the Falcon we know today.

That is true, but see your first question and wait.

Even I would be *amazed* if this happened. I expect Atari to show the
Jaguar and *maybe* the computers they have now (ie Falcon, TT, ST in that
order of probability) but not new machines.

>: Major updates to OS?
>TOS 5 you mean?

From what I've heard, this definitely exists (it is being used by some
people) but it is unlikely to be released publicly in the near future.
Hopefully if Atari don't want to develop it any more, they will license
it out to a 3rd party who will.

No Paul, you twit, QDGX has nothing to do with libs. It has to do with device independant printing (and application independant document formats).

>Well, it was groundbreaking maybe, in 1985 when the concept of reentrant

Groundbreaking in that the Amiga still doesn't have device independant graphics and has printing support that would embarrass even a 1970s era company. Something that the Mac and Windows and just about everyone else had a decade ago that the Amiga still doesn't have (and probably never will).

OK, let's compare some Digital Audio/Sequencing software.
I have Cubase Audio in my Falcon, it has 128 tracks of Midi, 16 Tracks
of 16 bit /16-48 Khz digital audio, Digital effects inc. graphic and
parametric eq's (realtime), automated mixing, 64-stave notation with
8-voice polyphony, DSP-functions like Dithering/Normalizing/Reverse/
Pich/Timestretch, It can function as keyboard-based sample player with
velocity, you can sync it to any tapemachine or ADAT, There are 11
external modules available for it, etc, etc.
Furthermore, it's fun to use it.

Is there any other machine around that can do that?! Amiga?

I *LoooVE* my Falcon!

Pete, how come you love the Lynx but hate the Jag?

They are similar in lots of ways: highly advanced for their time for the type of machines that they are, a tad overpriced, not selling too well initially due to *slight* Atari cock ups.

If you have the balls to admit the Lynx is a good machine (which took something for you to do in this newsgroup) what is your rationale for calling the Jag a piece of shit??

Skip.

If only Atari didn't let their machines stagnate, they could have improved them. Imagine a second or third generation Mega STe/TT/Falcon. Oh yeah....

PS: does anyone know if the Nova graphics card will let you play games on a VGA set to 320x200x16?

Ummm, maybe because they were done on SGI systems? IMHO, the only reason companies would switch to anything other than an Amiga would be for simple support. Industrial Light and MAgic use SGI systems for their animation (which is where Jurassic Park and Terminator came from). The Amiga is the cheapest route to VIDEO ANIMATION (yup, I said VIDEO ANIMATION, _not_ VIDEO TITLING). Amblin Imagin employs over 40 Amiga's networked in a Toaster farm, which enables all of them to work on the same scene, greatly increasing overall speed. Why do you think they went the Amiga route instead of the SGI route? Because it wass cheaper. If there is anything for the Amiga that is supported at a grand scale, it would be the Video/Graphics world...every month new objects and scenes are coming out. Video Toaster has it's own magazine. New versions of the most popular ray tracing packages are released. But ya know what makes the Amiga so popular? It's 15KHz NTSC video output. Try running a PC with some hardware that outputs 15KHz...first, you're going to pay an arm and a leg (around $3000), and it's not going to be near the quality of an Opal Vision set up, or a Video Toaster set up.

: Look at the quotes. Babylon 5, Seaquest DSV and the TV Robocop all use
: Amigas in their animation. I suppose thats not a serious enough use....

: > don't use Amigas. And don't get this post confused with video TITLING
: > please. I'm not talking about that.

B5, Robocop, DSV...you actually are able to sit there and say these aren't modern? Last I checked, they had new episodes coming out every week. If that isn't modern, please explain to me, in your eyes, what is. And as for your VIDEO TITLING, why are you putting such an inphasis on that? The main point in the original posters comment was VIDEO ANIMATION, and he gave you _modern_ examples of the Amiga's use in them. Just becaue one studio isn't using Amiga's, does not mean the next studio is phasing them out. Please think before you post.

: Hmm, those shows aren't modern?

I guess they aren't in his eyes...(he must be dreaming)

Huh? Amiga has device independant graphics! I got it from Paul a few
years ago, it's called EGS.
And Amiga's printing support is quite nice, actually.

ECS? Hah.

>And Amiga's printing support is quite nice, actually.

You're hallucinating. The Amiga's print support is so bad that developers
still have to write their own drivers (see: Pagestream) if they want
to get decent output.

Maybe you need an update. QuickTime movies haven't had to make the tradeoff you mention since QT 1.5, circa 1992, when the Cinepak compressor appeared, giving you 15-20 fps at 320x240 (almost MPEG SIF resolution) - hardly small and fast *or* large and slow. QT's Cinepak performance has continued to increase with succeeding versions, as has the data throughput, so that on a Quadra 475 (the lowest of the low-end Macs, at $800 for a 25MHz LC040) you can get 320x240 at 30fps or 640x480 at 15fps.

I don't hate the Jag, I think its a fine console. The price should be reduced to $150 for any chance of survival. I am just saying that the Jag will suffer the same fate as the LYnx and the Falcon. I still can't find a Jag in my area. There are lots of Nintendo's, sega's and 3do's localy.

>
>They are similar in lots of ways: highly advanced for their time for the type
>of machines that they are, a tad overpriced, not selling too well initially
>due to *slight* Atari cock ups.

There is no doubt that the Jag console is highly advanced, but it is the software that makes or breaks a console. Where just seeing games out for Nintendo that are truly exploiting the hardware.

>
>If you have the balls to admit the Lynx is a good machine (which took something
>for you to do in this newsgroup) what is your rationale for calling the Jag

First you'd have to find someone remotely interested in the OS or in merging.

Even SoftLogik has pulled out of the Atari market. (There will be no PageStream 3 for the Atari.) However they have announced development of versions for the Mac and Windows.

Well, this is an atari group, so I just have to point out that GEM has had device independant graphics support since the first release of GDOS...around about 8 years ago.

The latest release supports use of True Type, Postscript & Bitstream vector fonts as well as bitmap fonts (should you want them) and provides a program transparent system for selecting the device - rather like windows does.

Does Commodore officially support EGS? No?

Amiga's printing support is horrifyingly bad. Anyone with a HP500C (or
-any- other non-perfect clone of an Epson dot matrix printer) knows all
about that. It remains an OS that -nobody- writes drivers for, and it
remains an OS that has only the simplest level of support for the modern
printer.

DIG and enhanced printer drivers are a requirement.

Yes, actually. Just before their demise they had adopted EGS as their
RTG system of choice...

Which, of course, is why Citizen, HP, Epson, Primera, and a handful of
other printer manufacturers produce Amiga printer drivers, and why
products like Citizen PrintManager exist. That's a sure sign of lack of
support... You Merkins seem to forget that outside of the US people
actually acknowledge the existence of platforms other than PC and Mac.

>DIG and enhanced printer drivers are a requirement.

We meet your requirement. Can I go now?

Ha ha ha ha ha ha. So were are the games?? Meanwhile there are at least half a dozen new 3dogames this week. Atari will never earn the money to challenge anyone in the computer market. There are going to be alot of disgruntled Jag users after Christmas and most likely will see alot of used orphans for sale.

With Atari now licencing TOS and MagIX on general sale it would be possible to build superb non-atari boxes. For example hardware companies simply design buyin MagIX (in a similar was to MS DOS) and all of a sudden we have a string of Atari Compatibles.

Perhaps then we can have affordable Falcon compatibles that run at a half decent speed, having said that the Falcon is quite fast as it is, certainly more so that a 386/486.

Atari is only a threat to Apple in the computer market if it gives some
incentive for large multiples like Dixons, Comet etc to sell Atari hardware.
Also they can only do this if they do what Apple did ir supply it with
a monitor and a good range of games and applications. All it takes
is a coherent plan and who know perhaps well see Atari with a decent
market share.

Until a few years ago Apple stuff wasn't really a high street product,
now you can get MC CD ROMS and hardware in most shops.

Why is there no support in WB3.1 for EGS? From my understanding of the
matter (I bailed out when WB3.0 was out for all Amigas, roughly) WB3.1
likes Picasso II cards, but little else. Am I missing something?

That is true. Sure would be nice if they shipped that stuff on this side
of the pond. I called HP numerous times for a HP500c driver - they kept
telling me I would need to spend $75 for a third party driver. That's
insane.

>
> >DIG and enhanced printer drivers are a requirement.
>
> We meet your requirement. Can I go now?

I haven't seen any meeting of requirements. How's the Postscript Level 2
support? More importantly, can it load .PPD files for any type of printer
shipped, so that -any- (Postscript) printer has a specific driver for it
so that the driver takes advantage (and knows about) all of that printer's
specific functions?

Put a high end postscript printer into 1200 dpi on an Amiga. Can you even do 600 dpi or 800 dpi?

-STOCK- output from a Postscript printer at 300 dpi, as of WB3.0 (FINALLY!) isn't a problem. Taking advantage of printer-specific Postscript output is.

>>years ago, it's called EGS.
>
>ECS? Hah.

You have problem with reading_
He said EGS. NOT ECS.
ECS is a graphics chipset, used in 2nd generation Amigas.
EGS is the device independat graphics system.

If you buy a modern Amiga graphics board, it
most probably uses EGS.

Besides, those Amiga GFX boards that DON'T support EGS,
have their own style of device ind...etc stuff, that allows useers to
promote their software
to the GFX board resolutions.

>
>
>

It's you hallucinating.
I got pretty good stuff printed with Amiga's own drivers, and
2 my friends who print a lot of stuff get very good quality using all
those standard AmigaDOS drivers. Of corse both of them have AmigaDOS 3.0.

HP doesn't over here; what HP may do in your country has to do with the distributors and the different market conditions. If I still had my A3000, I'd say you were lucky.

What's this then? I don't actually have a PS printer, so I don't know
about this .PPD business (and .PPD is a purely PC-centric term, anyway.
Skip the leading . and you're closer to the mark.) but I can produce
output on any PS printer. This file should print "Test of PS output..."
and draw an oval. It's NOT a bitmap, like several people have been
insisting that the Amiga ALWAYS produces, it's a generic PS file.

I love Atari fans. They're such easy targets.

>> Yeah, right: as if APPLE is in its glory years.. We don't ahve to
merge to
>> stay alive..

NOBODY WANTS Atari. Nobody. Apple is having a record profit year, BTW.
How's Atari doing comparatively? I hear those 6 Jaguar carts are
selling well.

>>We don't sell copyrights of the OS to keep up in the storm..

You couldn't sell it if you tried. You don't even own it as far as I
understand. Wasn't GEM licensed?

>> And the Atari market is more specific than apples, for the difference
in buying a mac or some ms-clone has faded

Huh?

More specific apparently means mail order only. Even in Europe, the
ST's last "stronghold" (and I use that term loosely), the ST is dead.
Would you kindly wake up and move on with your life. Arguing for the ST
is like arguing for the C= 128, a great computer in it's time...10 years
ago.

Puh-lease!

Paul Thurrott

Who's Sinflop? I am Sinclair.. As for the Jagflop, there might be some hope
for it. I received my issue of Mac Home Journal today, you know the Christmas
issue. Well anyways, the rag reviewed the game consoles, ie..Sega, Nintendo,
3do and you guess it the Jag.. Guess which one came out on top? The jag..
They liked the Jag. There was also a point in the article, is this is the
christmas for the make/break for the Jag.

Oh, you made one or two mistakes of vocabulary in this statement. Instead
of 'nearly', you should have used 'hardly'. Besides the graphics apps, _no_
Amiga application runs in more than 256 colours (at least Final Writer,
Twist II, DeliTracker, PasTeX, etc. don't) due to the fact that they are
StyleGuide compliant (the StyleGuide says, among other things, that apps
should use the WB screen if possible) and C= were unable to finish RTG
before they went bankrupt.

To some degree, yes. Now, Chris, how does the resolution of the printer
compare to that of the screen?

Well, the Amiga home computer line has abandoned C=, AFAIK. There are still
some software developments by Atari, though (SpeedoGDOS 5.0 by Compo/Atari
or MiNT 1.12 are examples).

> I remember at the start they did try to sell the Falcon and boasted of
>having such and such in developement for it, but now - nothing.

They list Atari gave out on the CeBit contained the software projects of
3rd party developers. Some (many) o the programs hit the market. BTW,
Atari, as C=, were never engaged in software development that much.

> The Falcon is an end-of-line machine. The Amiga could well be in the

>is better.

The Amiga IS in the same position. Where is the global survey for the sheer
number of Amiga users vs. Atari users?

It's higher, but if the printing is done as a bitmap it is generated
internally, not printed from the screen. The only thing I've ever seen
that prints text as a screen bitmap is the crappy notepad that came with
KS1.3. (Oh, and DeluxePaint, but that's a bitmap paint package, so it
has no choice.) All the other apps I have that print text-as-graphics do
it at the resolution of my printer, and I just posted a PS file yesterday
to show that PS files AREN'T printed as bitmaps.

Sheesh...

Ummm... no I said absolutely NO Operating system supporting this feature set computer wide. THAT'S why it holds so much potential. I KNOW the amiga doesn't do this (pats his A3000 next to the mac) Nothing, nada, no way. Unless, of course, I got the wrong OS from Amiga, wait, this is the latest and greatest according to millions (ok, 100s) of Amiga owners in the world. Nice try, this is the 1st time its been done cause it took alot to do.

That's funny, I have ALL of my programs being redirected to my gfx card.
I'm starting to wonder what planet your living on. The Amiga supports
higher colors than 256, this is quite apparent in drawing programs and
gfx manipulators. But why would anyone want to use a 16million color screen
for their word-processor? Seems like a waste of memory to me. They might
want to display some pictures in their text, but 256 colors does just fine,
It's not like they don't know what the picture looks like already, and it's
not like the Amiga prints what res is being displayed on the screen.

And why on Earth would anyone want to display their MOD-Player in more than
256 colors? It should barely need four colors (Style Guide Compliant)

: matter (I bailed out when WB3.0 was out for all Amigas, roughly) WB3.1
: likes Picasso II cards, but little else. Am I missing something?

The Picasso II cards are less of a hack than the other cards on the market
that is why they are more stable and work with more programs. (This of course
is based on my knowledge of gfx cards from about 5 months ago , so I am
not allowing for upgrades)

Besides, the Picasso II people are licensing the ROMS, and have the rights
to sell it so they had more of a chance to upgrade their software, to be
more compliant with OS3.1 than the other manufacturers did.

I haven't said that. PS is nothing new, and it's about time the Amiga got
it in the OS.

Sorry, but a simple PS file being posted doesn't prove the Amiga can take
advantage of even simple printer features (like 1200 dpi, and so on.)

The problem is that they aren't being written anymore (over here).

WOW! A whole TEN games and its only been out for a year and two months!

Even the Sega 32x managed to have Doom out before the Jaguar and it had
only been around for a week.

I dunno. Since theres LOTS of software for the Amiga and very LITTLE for
the Atari I'd guess that the software houses know that there are a lot more
Amigas out there than Ataris.

I do know that AT LEAST 300000 A1200s were sold and 100000 CD32s not to mention
tens of thousands of A4000s JUST IN THE UK.

Compare that to Falcon sales of _maybe_ 100000 worldwide.

Regardless, it would be nice to -always- have WYSIWYG. Why not? Answer:
Amiga graphics chips aren't fast enough to support 24 bit color all the
time. That's the real limitation. Most people would love 24 bit graphics
if there was little or no performance penalty.

> And why on Earth would anyone want to display their MOD-Player in more than

Indeed, why use more than 2 colors and a text-based interface?

They'd LIKE it, sure, but do they NEED it? At work I have a pretty nice
24 bit card, but I've never used it except for displaying the odd JPEG
now and again. The rest of the time I'm running apps that don't use more
than 16 colours, or maybe 256 occasionally. The majority of people run
MS word or WP or a similar program, and the only time they'd need 24 bit
graphics is if they're importing a 24 bit picture, which is unlikely
unless they're a professional (in which case why are they using MS
Word?), and even then the picture would have to be scaled down in
resolution to be displayed on the screen, so you may as well scale the
colours down too.

reading rec.games.video.atari I'm not sure that theres _that_ much of
an improvement. Better, yes, but since Doom has been touted since the start
of the year for the Jaguar, its hardly surprising that its version is
slightly better than that for a machine announced only a couple of months
ago. The general opinion is that it doesn't even come close to a good
PC for speed and detail and of course you don't have the option of
WADs and editors. Nor do you have a decent save game or music.

If you want to play the Best version of Doom - get a PC. So much for
the wonderful 64-bit Jaguar with 65000 colours on screen.

Its now been shown that the Jaguar can't even match the current state
of play in computer gaming - the PC, so its chances of competing with the
next generation of Sega, Nintendo and Sony super-consoles are low. Its
only on a par with a 32-bit add-on for a megadrive.

: ago. The general opinion is that it doesn't even come close to a good
: PC for speed and detail and of course you don't have the option of
: WADs and editors. Nor do you have a decent save game or music.

Read again. The version of Jag doom is considered by many to be
VERY close to the PC version for speed. You can save game via password,
and while it doesn't have level editors, it DOES have levels that are
different from the PC version. The lack of music is a definite disapointment.

: If you want to play the Best version of Doom - get a PC. So much for
: the wonderful 64-bit Jaguar with 65000 colours on screen.

How much do PC's cost? A hell of a lot more than a Jag ...
especially if you want to run Doom.

: Its now been shown that the Jaguar can't even match the current state
: of play in computer gaming - the PC, so its chances of competing with the
: next generation of Sega, Nintendo and Sony super-consoles are low. Its
: only on a par with a 32-bit add-on for a megadrive.

That's pushing it Gaven. Nothing has been "shown" yet. Do you
think ealrly SNES programmers thought that Donkey Kong Country was
possible? The Jaguar is still new. It's also expandable and a technical
wonder.

I posted the question "Is Atari still making computers?" in c.s.atari.st,
which is, unlike this zoo, a serious newsgroup. All the responses that
I have gotten so far say, unfortunately, that Atari is indeed out of the
computer business.

4885. Apple have a stand at german Atari Show

Newsgroup: comp.sys.atari.advocacy
Date: 1994-11-28 22:10:18 UTC
From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <3bdkga$mec@whitbeck.ncl.ac.uk>
Source record: 14585

Interesting to note that Apple had their own stand at a recent Atari
show in germany, selling 680x0 Mac's running MacMagic, pre-emptive
multitasking TOS clone. This couldn't have been an attempt to ween
the german atari userbase (much larger than the german apple userbase)
onto Mac hardware by letting them carry on using decent software
like Calamus on a decent (ie faster & more stable than MacOS) OS?

Surely not.......

Comment?

Craig.

: You're hallucinating. The Amiga's print support is so bad that developers
: *still* have to write their own drivers (see: Pagestream) if they want
: to get decent output.

Hun? Let me ask you, seriously, have you ever printed on an Amiga?
I just bought a Canon BJ-200e printer, which (of course) only included
Windows drivers. No worries, though, I just picked the BJ-10 printer
driver in the Printer Prefs program, and away I go (The BJ manual gave a
list of print drivers compatabile w/ the -200).

Now I can print with 99% of all Amiga software out there, without a worry.

As far as Pagestream went, there was no driver, but a quick peak at
AmiNet produces PD drivers for all KINDS of printers, mine include.
Problem solved.

I for one don't understand why Pagestream went and reinvented the wheel,
but I'm just glad installing a printer ment for another platform was as
easy as it was. In fact, there's even an IMAGEWRITER driver...How about
that!

: compare to that of the screen?

That depends on how you print it.. You can print it in a 1:1 ratio, scale
it to the full print area of one or more pages, or scale it upto the
maximum area with the same ratio..

Also you can print images larger then the current screen without any
problems.

You are forgetting about two very important facts here:

1. We are talking about ATARI.

2. Yes, probably they had the intention of making more, but
for ECONOMIC reasons they had to stop. This happens with
companies, particularly when they are losing money (like
ATARI still is right now).

|> Also I doubt they would be stupid enough to build thousands of Falcons
|> in one huge batch and hope to sell them ASAP.

No, probably they made a lot of them and they got stock piled... and
they sold pretty slowly. This is what ATARi reported themselves (sloooow
sales of the Falcon). But hey, why argue? ATARI SAID that they are
out of the computer business.

: ATARI still is right now).

Yep. Between the time the Falcon was announced and when it made
it to market, the prices of clones had fallen incredibly. What seemed
like a great computing value at first, quickly became an expensive
venture.

: No, probably they made a lot of them and they got stock piled... and
: they sold pretty slowly. This is what ATARi reported themselves (sloooow
: sales of the Falcon). But hey, why argue? ATARI SAID that they are
: out of the computer business.

Atari initially expected to sell 300,000 Falcons in their first
year on the market. When the market changed, Atari abandoned heavy Falcon
advertising plans to concentrate on the Jag ... and the survival of
Atari. While it sucks for Atari computer users, we have to remember that
Atari (like any other company) is in business to make money. I always
like the concept of their computers and hope that they will return to the
computer scene someday. I also hope C= gets ressurected. I like having an
alternative to Macs and PCs.

Cheers,

The Jaguar has now been around since October LAST year. Thats 13 months.
And Jaguar Doom was _still_ beaten to the shops by 32X Doom - a game for a
machine that had only been out for TWO WEEKS.

Since developers had their systems before the machine was released, I think
we should be entitled to see a higher quality of software by now, don't you?

You could say the same about potential for the 32X, only it really is new.
And then theres the Sony Playstation, Sega Saturn and Nintendo Ultra 64 (the
last one looks a bit dodgy IMO) on the way. These machines will have more games
within a month than the Jaguar has had in over a year. And the games will be
of high quality too.

No-one doubts the tech-specs of the Jaguar, but as a well supported platform
with a future, the prognosis is NOT good. Don't blame me for that. just ask
Atari how they've managed to do it again (like they did to the Lynx).

> So your finally getting your own computer! It's about time!

Hold on a second, Sinflop, you say you're gonna upgrade your machine to
PCI by a motherboard swap - just after you criticise 486s for not being
upgradable to Pentiums. PC owners can of course upgrade their motherboards
with a LOT more ease than you'll be able to do a swap on your mac. You can
choose a number of different processors and boards, from hundreds of suppliers
unlike Apple where you're limited to whatever Apple comes up with.

And as for your analogy about adding a PPC card to certain Macs, you can
just as easily add and 030/040/060 to whatever model of Amiga.

Typical mac user - you find you can swap a motherboard and Hooray! Another
great Mac innovation! Hey! I can add a faster processor to my machine! Wow!
Another great Mac innovation!

I just love seeing these people who don't know the first thing about
computers claim, when they see something that other computer users take
for granted for the first time on a Mac, that 'only the Mac has this facility'.

It just convinced me that Macs appeal (as home machines) to people who are
completely clueless about computers. Of course, such people shouldn't try to
slag off owners of real computers with their limited Mac knowledge, but then
thats never stopped you, has it?

Excuse me, can we cut all this crap about Doom please, Doom is a crap game,
it has no gameplay unless you're in network play, the graphics are naff, look
at the banding effect on shading (PC version) if you don't believe me.

If you want to look at a game that the PC does well, look at Wing Commander III
but please, stop associating Doom with the PC it's, well, embarrasing...

: : If you want to play the Best version of Doom - get a PC. So much for
: : the wonderful 64-bit Jaguar with 65000 colours on screen.

: How much do PC's cost? A hell of a lot more than a Jag ...
: especially if you want to run Doom.

I bought my PC for application software. As a consequence I can play
Doom and a whole host of other games that you'll NEVER see on the Jag.

Can you run any application software on your cheaper Jag. Thought not!

: : Its now been shown that the Jaguar can't even match the current state
: : of play in computer gaming - the PC, so its chances of competing with the
: : next generation of Sega, Nintendo and Sony super-consoles are low. Its
: : only on a par with a 32-bit add-on for a megadrive.

: That's pushing it Gaven. Nothing has been "shown" yet. Do you
: think ealrly SNES programmers thought that Donkey Kong Country was
: possible? The Jaguar is still new. It's also expandable and a technical
: wonder.

I showed myself....

Steve

In <3beubv$br6@infa.central.susx.ac.uk> kaps3@central.susx.ac.uk (Steven Constantine) writes:

>How much does the upgrade cost?

Here in sweden ~2000Skr (~180 UKpounds)

>I can upgrade to a Pentium, selling my DX2 chip to offset the cost.
>Works out to be a cheap upgrade.

Yep... agree!

>So what, that whats I have, therefore i use 64K colours etc... What is
>your point.

The point is that it's OLD lousy teknology... Well it works, but it doesn't work as good as it could work with a more inteligent design... Isn't it OUR choice NOT to use certain Hardware if we don't like it? This IS an ATARI group, we don't advocate PeeeCees here! Got my point (and Chris point too! .^)

>The AWE32 is a major step forward from the old Sounblaster 16 (I have
>this one) but it is hampered by a lot of software incompatibilities -
>something like being to advanced for its own good!

Still, ALL Falcon has a DSP and 16-bit AD/DA, maybe not the greatest, but there is NO problems with incompatible software, like on PeeeCees... Agree?

I think it's good that there is NICE addons for PeeCees BUT why don't YOU let us advocate our addons for the falcon? Still not many PeeeCees can compete with a Falcon in the areas where the Falcon is superiour! I like the Falcon for the BUILTIN hardware, it might not be the fastest or the best, but it's there and it's in ALL Falcons! (Like the DSP, Midi, SCSI-II, IDE! and many many more!

>Wave Studio that comes with the SB16 seems to me to have more facilities
>that I need. I can record CD D2D at 44KHz, 16bit stereo and save in
>numerous formats - with .8Gb of drive space, no problem with room. By
>the way, I have a PCI bus.

Yep, you have a MONSTER machine :^D Well still I KNOW thaat the Falcon outperforms your 66Mhz! PCI equiped PeeCee when it comes to sound... you propably will kill my little Falcon when it comes to heavy CPU usage, like for Raytracing or so... although the falcon has it's hidden card: the DSP :^D For some tasks it's really nice, like playing MPEGs!

>Ah, but who wants a 1Mb 0HD falcon - it's about as useful as chocalate
>oven-gloves!

Agree... BUT how much do you have to pay to get a PeeCee with DEACENT hardware that will Fairly come close to the HARDWARE in the Falcon? Forget all lousy cheap ADDs in some Magazine... I would like to see a PeeCee with deacent memory, harddisk and video performance WITHOUT having to have loads of CACHE for it all... Providing DMA for it all too!?

>If you're dumb enough to use the machine without a keyboard then stick
>to ZX81.

Hmm.. that wasn't what I wrote.. I meant that the BIOS in a PeeCee is crap! So you agree with me that that is the case then?

Yo mean: If the computers don't do as you like then it's NOTHING wrong with the machine, but with the user who is to dumb to understand the machine?!

Sorry if I missunderstoiod you, but that's how I read it! (Look I genarileze it a bit.. meaning not just that specific Error message... I keep getting stupid errors all the time!)

>I was very upset to have to get rid of my dearly loved STe - I'd had it
>for 4yrs. Believe me, it doesn't take long to work up affection for a
>new machine. PCs are not as impersonal as most people feel. I've seen
>the grass on both sides - it's just as green.

>Go buy a sun sparc then. I fail to believe that you see the Atari as;

I would like to have a PeeCee... running LINUX! If I could afford it I propably would have bought a SUN or some other HEAVY machine! Now that is NOT the case... Still my Ataris does what I want them to!

>1) a better games machine

Hmm.. I like Shanghai... those I have sean still is better on my ST then on a Pentium running WindoZZzzze and Teipei!

>2) a better WP machine

Hmmm.... how do you mean... isn't that a bit related to wich SW you use? I use TeX and Emacs... like that better then Word version [anything]!

>3) a better multitasking machine

Linux Mutitasks quite well... OS/2 does it too, or so I heard! But what WindoZzzze do, thet is still a mysterie for MANY users!

>4) a better mathematical machine.

I really would like the guy who had the test for the Pentium to repost it... It prooved that the Pentium Could not do the Math! ;^D

But I agree that a 486 or pentium is ALOT faster than my Falcon... but better? NO!

>i.e. if you can't get a PC do do the above, then you need to read a book
>- like Peter & Jane.

But I get my Falcon to do it all too... WHY must I use a PeeCee then?
I never said that a PeeCee couldn't doo anything... I just said that I
don't like HOW it do it.. therefor I don't use them!

>Sure, music maybe the Falcon's forte, but don't try an pull the wool
>over everyones' eyes that the PC can't manipulate music.

Not as _good_ as a Falcon!

>It's about time this was done - who's up for it?

Well, hope my little change of the group worked! .^D

>Regards,

Well you didn't insult me? I thought "Fuck you" where your standard
phrase to end a post with! ;^D

I send many regards to you too!

>Steven.

4901. Toad Holiday Fest '94 Update

Newsgroup: comp.sys.atari.advocacy
Date: 1994-11-29 16:47:50 UTC
From: toad@charm.net
Message-ID: <3bflvm$60t@sowebo.charm.net>
Source record: 14451

The following is a hucksterish plug for Toad Computers Holiday Festival '94 which will take place this coming weekend at Toad Computers in Severna Park, Maryland. If you are unable to attend or are not interested in reading about the show, please feel free to skip this article. Thanks -- from the folks at Toad Computers.

TOAD COMPUTERS -- HOLIDAY FESTIVAL '94! -- DEC 3 & 4, 1994
==========

== THE SHOW IS APPROACHING FAST! ==

IF YOU'RE LOOKING FOR ATARI EXCITEMENT, DON'T MISS
TOAD COMPUTERS HOLIDAY FESTIVAL 1994!

The show will take place at TOAD COMPUTERS in the Park Plaza Shopping Center in Severna Park, Maryland. There's unlimited free parking and lots to see and do nearby, as we're nestled between Washington, Baltimore, and Annapolis (eat the great local seafood!).

Confirmed 1994 attendees include:

- Tom Harker, ICD Inc. (CatBox and Star Battle)
- Roger Burrows, Anodyne Software (ExtenDOS CD Driver)
- Gribnif Software -- Dan Wilga / Rick Flashman
- Wizztronics (Falcon enhancements & more)
- Bob Luneski, Oregon Research
- Jim Fouch, Fouch Software (Mailing Manager ST)
- MajicSoft
- Binary Sounds (Hybrid Arts Product Line)
- Joe Waters, Ed. of Current Notes
- Greg Ondo, Steinberg Jones
- Charles Smeton (STraight FAX!)
- And of course, the Toad Gang -- including
Dave and Jennifer Troy

ATARI ST / TT / Falcon, Jaguar, Lynx, Portfolio and 8-Bit!!
Come SEE IT ALL at the nation's premier ATARI Outlet!

TOAD COMPUTERS HOLIDAY FESTIVAL '94:

Saturday December 3rd 10:00am - 7:00pm
Sunday December 4th 10:00am - 5:00pm

Toad Computers
Park Plaza Shopping Center
570 Ritchie Highway
Severna Park, MD 21146-2925

Voice: (410) 544-6943
Orders: (800) 448-8623
FAX: (410) 544-1329
BBS: (410) 544-6999
TOADFAX: (410) 544-0098

For MAPS, DIRECTIONS, HOTEL ACCOMODATIONS, or any other
information you may need, please call us!

The local HOLIDAY INN is offering $59 (reg $90) rooms for the
show. For more information, please call us at (410) 544-6943!

LOTS OF FOLKS KNOW ABOUT THE SHOW:

- 5000 Postcards Mailed in mid-November
- Featured on the back of our latest catalog
- Advertised in Current Notes & ST Informer
- Advertised Electronically (Internet et al)
- Highway Signage

SPECIAL ICD PROMOTION:

ICD is offering a special promotion at the show. Buy an
AdSpeed ST/STE for $159 _INSTALLED_. The board will be
installed & your computer shipped back to you FREE or,
time permitting, the board can be installed at the show --
ABSOLUTELY FREE!

This is a great opportunity to get your ST going faster
and save a little CASH! Bring your machine to the show
to take advantage of this great deal!

A SAMPLING OF WHAT WE'LL HAVE FOR THE SHOW:

- Falcon030's (LOW!) - Hard Drives
- TT030's - Hand Scanners
- 1040STE's - 450 Mice
- Stacy's - 125 Trackballs
- Mega STE's - Joysticks
- Laser Printers - ALL NEW SOFTWARE
- CD ROM Drives - STraight FAX! (Show Special)
- Monitors - Disks
- Power Strips - Mousepads
- Books - 8-Bit Hardware
- ST Hardware - Games
- DTP Software - Printers
- Multimedia Speakers - Internet Demos
- Lynx / Lynx Games - Jaguar
- NEW JAGUAR TITLES! - Codehead Stuff
- Printer Ribbons - FAX Modems

- Great deals on all hardware and software
- Full selection of Atari hardware & software
- Atari Falcon030 Computer Systems at Special Discount Prices

- Super Low Clearance Prices on a wide range of items
including discontinued hardware and software, store demo
equipment, and much more!
- Our Toadally Cool Dog, Zoe

- Free Hot Apple Cider (and cookies if you're good!)
- Special "Kid Korral" with fun stuff, like crayons
- Dave Small's Own "Live Rust" Neil Young Album,
The One To Which Spectre was Programmed!
- Demos of hardware and software!
- NETWORKED JAGUARS!

=== MUCH, MUCH, MORE! ===

OTHER COOL STUFF WHICH IS ON ITS WAY TO US (As We Speak):

- Over 14,000 ST Games
- ImageCopy 3.5CD (Supports Photo CD Pictures)
- NVDI 3.0 (New Version)
- MagiC (Newest Version)
- Desktopper (Falcon Case)

STUFF WE'RE GIVING AWAY:

- Jaguar System (Raffle to Benefit Habitat for Humanity)
- Jaguar T-Shirts, Mugs & Bumper Stickers
- Codehead T-Shirts
- Free Toad T-Shirts to First 25 Attendees
- Games
- Lots more!

How much would you pay to be a part of a celebration like this? $3.98?
$14.59? $75.00 Non Refundable? Well, no need! Admission to TOAD
COMPUTERS HOLIDAY FESTIVAL '94 is ABSOLUTELY FREE!

In the immediate area is historic and scenic Annapolis! Annapolis had
been the capitol of the thirteen colonies under the Articles of the
Confederation. Its historic state house is the oldest in use in this
country and its white dome was built without the use of nails.
Annapolis has a truly quirky personality that is a combination of
southern hospitality, northern charm and historic clout. For you
military buffs, Annapolis is the home of the United States Naval
Academy. It is open to the public and features several museums,
exhibits, and historical buildings. Annapolis is also home to some of
the best seafood in the world, straight from the Chesapeake Bay.

Toad Computers is TEN MINUTES away from downtown Annapolis.

Also nearby is Baltimore, home of the recently renovated and world
famous Inner Harbor -- a huge shopping and eating fiasco that's
just minutes from some of the city's most historic sites. In the
inner harbor area, you can visit the National Aquarium (home to
thousands of species of marine life) which also features a working

rainforest in its pyramid shaped dome. Visit the Maryland Science Center, home to a huge I-MAX theater and also packed with hundreds of constantly changing exhibits that relate to science, computers, and more. Visit the home of Babe Ruth, Betsy Ross, or Edgar Allan Poe. See the new stadium for the Baltimore Orioles -- Oriole Park at Camden Yards. You might also want to visit Fort McHenry -- the rampart that still stood after a night of bombardment in 1812 that led Francis Scott Key to write our national anthem to the tune of an old drinking song. Find out why this happened! Visit the B&O Railroad Museum where you can learn about the story of the rise and fall of the greatest form of transportation this country has ever known.

Toad Computers is THIRTY MINUTES away from downtown Baltimore.

Lastly, you may want to make a stop in Washington DC -- murder capital of the world and Capitol of the United States. Where else can the mayor of a city smoke crack and get RE-ELECTED? Come see the White House -- maybe you can visit Bill Clinton at home and give him your ideas for healthcare reform (yeah, like we're gonna see that anytime soon). Visit the Smithsonian Institute, National Art Gallery, countless memorials (Iwo Jima, Viet Nam, Jefferson, Lincoln, Washington Monument), and more. There is more to do in Washington than I could ever begin to list here with any justice. If you do want to go to Washington, check with AAA to make sure that you're not missing anything. It is truly a city with something for everyone.

Toad Computers is FORTY FIVE MINUTES away from downtown Washington.

HOTEL ACCOMODATIONS

If you plan to visit the Annapolis area from out of state, there are several hotels in the area that we may recommend:

Sheraton At BWI Airport 15 Minutes Away
(410) 859-3300 On Airport Grounds

Loews Annapolis Hotel 15 Minutes Away
126 West Street Downtown
Annapolis, MD 21401 AAA 4 Diamond Rating
(410) 263-7777 Somewhat Expensive

Days Inn 10 Minutes Away
1542 Whitehall Road Next to Outlet Mall
Annapolis, MD 21401 on U.S. Route 50
(410) 974-4440 Near Bay Bridge

** Holiday Inn 15 Minutes Away
** 6600 Ritchie Highway On Ritchie Highway
** Glen Burnie, MD 21061 (MD Route 2)
** (410) 761-8300 SPECIAL $59 RATE!

Historic Inns of Annapolis For you lovebirds who
(There are several) are just dying to
Church Circle have a romantic time
Annapolis, MD 21401 in the "ancient city."
(410) 263-2641 15 Minutes Away

For more information, please call Toad Computers at
(410) 544-6943.

==========

OK! So you're coming! TERRIFIC! Here's everything you need to know:

When: Saturday, December 3rd 1994 10:00am - 7:00pm
Sunday, December 4th 1994 10:00am - 5:00pm

Where: Toad Computers
Park Plaza Shopping Center
570 Ritchie Highway
Severna Park, MD 21146

So come see the Jaguar, see Falcons in flight, see Toad Computers (America's Atari Source and the only Atari Superstore), see the local attractions and have fun. And help us ring in the holiday season! We look forward to seeing you!

HOW TO GET HERE:

For a map to Toad Computers and the immediate area, see GEnie ST Roundtable file #25969 (PostScript) or #25970 (Img Format). Or just call and we'll FAX or mail it to you. (This is also available on TOADFAX!, our FAX-on-demand service.)

Come Visit! We're Expecting You!

From Annapolis: Cross Severn River using US 50 bridge (east).
Take MD 2 north (first exit across bridge).
Turn left at sixth traffic light (McKinsey
Road). Turn right immediately into Park Plaza
shopping center.

From Baltimore: Take I-695 (Baltimore Beltway) south to MD
route 10 (to Severna Park). MD 10 will
intersect with MD route 2 south. Take route 2
about 3 miles further. Turn right at sixth
traffic light, onto McKinsey Road, then
immediately right into Park Plaza shopping
center.

From Washington: Take US 50 (begins as New York Avenue) east to
Annapolis. Follow directions from Annapolis.

From Columbia: Take MD 32 east to I-97 north (to Baltimore).
Exit onto Benfield Boulevard towards Severna
Park. Follow Benfield Road to Robinson Road to

MD 2. Turn right onto MD 2; second light on
right is McKinsey Road. Then turn right
immediately into Park Plaza shopping center.

Once Inside
Park Plaza: Locate and face Jo-Ann Fabrics. Turn left and
proceed about 200 feet. We are on your left,
across from the Signet Bank drive-through
island.

The street address is 570 Ritchie Highway. If you need any further
assistance, please feel free to call us at (410) 544-6943!

We hope to see you here! Last year, we were really happy with how
things went. The holiday season is a really wonderful time to get
together with Atari folks and it adds a spirit of real levity and
excitement that is often missing at other Atari events. We're looking
forward to putting on a first-class show, and we hope you can join
us.

David Troy
Jennifer Troy
Ray Mitchell

They are not redirectable to certain graphics modes. Switching screens is
non-intuitive, to say the least. Even C= knew that (thus the StyleGuide
advice).

> : Twist II, DeliTracker, PasTeX, etc. don't) due to the fact that they are
>
>Delitracker in 256 colors.. yeah rite..

Yes, as any clean Atari and Apple app, my MOD-Player runs in the high-color
mode I am currently using (as does my text editor, my UUCP software package
and anything else on this system). Strange, eh?

>If an application uses the WB screen it is almost certain it can be
>run on an EGS system, any app using the display database in a correct way
>should be able to.

No application running on the WB will run in high colour or true colour
modes. Ist this statement correct? Is it correct for DTP on the Amiga?

So can I as well. I can swap out my 030 board for the 040 one and bring it
upto Performa and LC575 level. But, I will wait until next spring or summer
for the PCI upgrade.

As for choices for upgrade cards, I have that option too. I suggest you get
your ass out of your head and get a copy Of MacWorld, you will be surprised..

Very funny!!! First time I've laughed reading a post in a long time.

(I'm not an Amiga advocate,... but the point was taken... and true!)

> printer.
>

Here goes another Macintosh user who has not the slightest idea
about hardware and OS issues. To begin with, Amiga can do true
pre-emptive multi-tasking as opposed to the cheesy cooperative
multi-tasking which the idiots using the Mac think is great.
This actually shows up in printing, when the Mac has to interrupt
a sound process to be able to send 3 letters to the printer.
Check out Final Copy and Professional Page for high-quality
600 dpi post-script output within a few second.

Hint: Think about what you will write *before* you post.
Not about what you had written *after* you get flamed.

A blithering idiot named Mike Cohen puked out the following:

> Why don't all of you Amiga weenies take your machines and blow them out your
> a**? We don't want to play with you. This is just between macs & PCs. Go home
> and play with yourselves and let the grownups here talk about real computers.

I was not going to get into this thread, but I cannot stand it
when some blithering idiot, especially one who is stupid enough
to use a Mac criticizes the Amiga.
OK, net.bozo, here is some information:

1) The Amiga had an OS (Workbench) which could multi-task from
the first version. And this is true pre-emptive multi-tasking, not
the cheap and sleazy cooperative idea which Mac bozos think it to be.
When you are playing a digitized sample on the Mac, moving around
windows or loading an application will cause the song to be reduced
to digestive noises; try this on the Amiga and see how the sound chip
Denisse takes care of all this by itself.

2) Workbench had a CLI which could be called from within the GUI,
making it a perfect OS, both visually intuitive and functional.

3) The Amiga has always been a programmer's machine, since it is
very interesting to be programming 4 different chips in addition to
the the 68k.

4) Amiga users are serious people who can tell RAM from ROM unlike
Macintrash idiots who post silly articles to USENET arguing that
the Amiga is not a real computer.

Mike Cohen: Learn about hard-ware before you post, bozo.
You are only contributing to the negative image of the Mac
user as a total idiot.

That's about what I would pay to swap the DX2 for a P60

: >I can upgrade to a Pentium, selling my DX2 chip to offset the cost.
: >Works out to be a cheap upgrade.

: >So what, that whats I have, therefore i use 64K colours etc... What is
: >your point.

: The point is that it's OLD lousy teknology... Well it works, but it
: doesn't work as good as it could work with a more inteligent design...

I wouldn't be so bold as to say that the Falcon possesses new technology either.

: Isn't it OUR choice NOT to use certain Hardware if we don't like it?
: This IS an ATARI group, we don't advocate PeeeCees here! Got my point
: (and Chris point too! .^)

Hey, I've used Ataris for 4yrs and had no complaints with the hardware.

: >The AWE32 is a major step forward from the old Sounblaster 16 (I have
: >this one) but it is hampered by a lot of software incompatibilities -
: >something like being to advanced for its own good!

: Still, ALL Falcon has a DSP and 16-bit AD/DA, maybe not the greatest, but
: there is NO problems with incompatible software, like on PeeeCees... Agree?

Yep.

: I think it's good that there is NICE addons for PeeCees BUT why don't YOU
: let us advocate our addons for the falcon? Still not many PeeeCees can
: compete with a Falcon in the areas where the Falcon is superiour!
: I like the Falcon for the BUILTIN hardware, it might not be the fastest
: or the best, but it's there and it's in ALL Falcons! (Like the DSP, Midi,
: SCSI-II, IDE! and many many more!

Try upgrading the CPU, clock speed, even memory becomes difficult over 4Mb. The PC is a modular design, component based. simple as that. If you want it, you have to plug it in. I like the PC since I can add the hardware I need, not pay for the stuff I don't.(not implying that you do.)

: >Wave Studio that comes with the SB16 seems to me to have more facilities
: >that I need. I can record CD D2D at 44KHz, 16bit stereo and save in
: >numerous formats - with .8Gb of drive space, no problem with room. By
: >the way, I have a PCI bus.

: Yep, you have a MONSTER machine :^D Well still I KNOW thaat the Falcon
: outperforms your 66Mhz! PCI equiped PeeCee when it comes to sound... you
: propably will kill my little Falcon when it comes to heavy CPU usage,
: like for Raytracing or so... although the falcon has it's hidden card:
: the DSP :^D For some tasks it's really nice, like playing MPEGs!

I don't use my machine in an audio capacity, but still enjoy the high
performance over a RANGE of tasks, not simply excelling in one area - an
area that I don't use.

: >Ah, but who wants a 1Mb 0HD falcon - it's about as useful as chocalate
: >oven-gloves!

: Agree... BUT how much do you have to pay to get a PeeCee with DEACENT
: hardware that will Fairly come close to the HARDWARE in the Falcon?
: Forget all lousy cheap ADDs in some Magazine... I would like to see a
: PeeCee with deacent memory, harddisk and video performance WITHOUT having
: to have loads of CACHE for it all... Providing DMA for it all too!?

You and me both. BUT - I reckon you could build a DX2 66 machine for
alittle over 850 pounds - build your own, components mail order. Took me
2hrs to build, plug in and go. No problem installing drivers etc for the
hardware either.

: Hmm.. that wasn't what I wrote.. I meant that the BIOS in a PeeCee is
: crap! So you agree with me that that is the case then?

Yep.

: Yo mean: If the computers don't do as you like then it's NOTHING wrong with
: the machine, but with the user who is to dumb to understand the machine?!

Generallyu, most things that go wrong with a computer can be attributed
to user error. Concede that at least...

: Sorry if I missunderstoiod you, but that's how I read it! (Look I
: genarileze it a bit.. meaning not just that specific Error message... I
: keep getting stupid errors all the time!)

: >I was very upset to have to get rid of my dearly loved STe - I'd had it
: >for 4yrs. Believe me, it doesn't take long to work up affection for a
: >new machine. PCs are not as impersonal as most people feel. I've seen
: >the grass on both sides - it's just as green.

: >Go buy a sun sparc then. I fail to believe that you see the Atari as;

: I would like to have a PeeCee... running LINUX! If I could afford it I
: propably would have bought a SUN or some other HEAVY machine! Now that
: is NOT the case... Still my Ataris does what I want them to!

I have 250Mb of my HDs partioned over to Linux, runs a treat, but I have no grumbles with MS - NOT AFTER USING ATARI SOFTWARE FOR SO LONG THAT HAS A MIND OF ITS OWN. The familiar bombs - the good old reserved vector error and whatever 35bombs meant..??!!

: >1) a better games machine

: Hmm.. I like Shanghai... those I have sean still is better on my ST then
: on a Pentium running WindoZZzzze and Teipei!

HHmm - never heard of it - what about XWing, Inferno, TFX, Doom II, Outpost...?

: >2) a better WP machine

: Hmmm.... how do you mean... isn't that a bit related to wich SW you
: use? I use TeX and Emacs... like that better then Word version
: [anything]!

I am able to produce, using Word 6.0d, documents far superior to those I knocked together on Papyrus.

: >3) a better multitasking machine

: Linux Mutitasks quite well... OS/2 does it too, or so I heard! But what
: WindoZzzze do, thet is still a mysterie for MANY users!

Linux on a Falcon - hear that laughter in the background...?

: >4) a better mathematical machine.

: I really would like the guy who had the test for the Pentium to repost
: it... It prooved that the Pentium Could not do the Math! ;^D

Atari have presumably never made any errors with their hardware. That's childish of you to jump on the Pentium-downers' bandwagon. Care to point out any other problems with the pentium??

: But I agree that a 486 or pentium is ALOT faster than my Falcon... but
: better? No.

: >i.e. if you can't get a PC do do the above, then you need to read a book
: >- like Peter & Jane.

: But I get my Falcon to do it all too... WHY must I use a PeeCee then?
: I never said that a PeeCee couldn't doo anything... I just said that I
: don't like HOW it do it.. therefor I don't use them!

Fair comment. Touche for Atari.

: >Sure, music maybe the Falcon's forte, but don't try an pull the wool
: >over everyones' eyes that the PC can't manipulate music.

: Not as _good_ as a Falcon!

: >It's about time this was done - who's up for it?

: Well, hope my little change of the group worked! .^D

Did for me.

: >Regards,

: Well you didn't insult me? I thought "F*ck you" where your standard
: phrase to end a post with! ;^D

Apologies

Steven.

There has been a lot of doom and gloom in this thread about Atari. I have just read a post on rev.games.video.atari about the Milan project.

The poster gives details from a former employee of Atari Germany, which are to be printed in a french mag. next month. If half of what is said is true, it is quite obvious that Atari have NOT given up on computers.

I await more news next month about 'Milan'.....

Don't flame me, as I am just informing others who have not read the post about this NEW computer.

The post had the subject : NEWS about the new Atari Computer !

It's a lot never then getting a PC with technology from the mid-late 70th's! Even if it has a Pentium inside...

>Hey, I've used Ataris for 4yrs and had no complaints with the hardware.

Neither do I. _BUT- I've used PC's for many years too... and have LOADS of complains!

>Try upgrading the CPU, clock speed, even memory becomes difficult over
>4Mb. The PC is a modular design, component based. simple as that. If you
>want it, you have to plug it in. I like the PC since I can add the
>hardware I need, not pay for the stuff I don't.(not implying that you do.)

Not difficult... maybe expensive, but not difficult! And who likes a modular design when it's crap! Look at the Mega-STE and TT they have a VME-extension bus... far more superior over the ISA bus on a PC... Sorry thats one of the OLD standards... PCI is the newest! Pity just that there is so little things to add to the VME bus! Mostly GFX cards... And you can have more than one thing on the VME bus...

Even the MegaST have a extansion slot... and Falcon has one... Both comparable with a PCI bus! (LOCAL-bus?!)

I agree that there isn't easy to upgrade a ST or STE... but The rest of the Atari line of computers are easily upgradable!

>I don't use my machine in an audio capacity, but still enjoy the high
>performance over a RANGE of tasks, not simply excelling in one area - an
>area that I don't use.

Yes I also like the power in a PC, it's the crappy HARDWARE I don't like... and when the Software is crap too, there's NO reason for me to use a PC!

>You and me both. BUT - I reckon you could build a DX2 66 machine for
>alittle over 850 pounds - build your own, components mail order. Took me
>2hrs to build, plug in and go. No problem installing drivers etc for the
>hardware either.

Hmm.. Still you have crappy hardware ;^D I've built MANY PC's that way... Built one some months ago: 386dx/20, 2Meg ram, 85Meg HD, SVGA all mounted in a Towercase and it cost me ~100 pounds :^D But do I like it because it's cheap... NO! And would I spend more money on "better" PC hardware... Don't think so! I KNOW what it is.. therefor I don't buy it!

>Generallyu, most things that go wrong with a computer can be attributed
>to user error. Concede that at least...

Hmm... didn't you say that everything you did with your Atari ended up with bombs?! So it must have bean you that did wrong then? ;^D

>I have 250Mb of my HDs partioned over to Linux, runs a treat, but I have
>no grumbles with MS - NOT AFTER USING ATARI SOFTWARE FOR SO LONG THAT

Well, I'm used to usinmg a 600 dpi printer, which is a bit higher than my
monitor. Now if you select density 7 in thprinter preferences, then the max
resoloution supported will be used. Since Amigas use these things called
"scalable fonts", what is on the scxreen matters not much.

You really do have a problem reading, don't you. What do you think the
words "resolution independent" mean? Might it have something to do with
the fact that the resolution of the output doesn't depend on the file?
Might this mean that if you have a six squillion DPI printer, then it'll
print it at six squillion DPI? What a curious idea...

Multi-tasking isn't the only thing in the world. How about SOFTWARE and
HARDWARE support? Why don't you go to your local egghead and buy a copy of
Word 6, WordPerfect, Excel, FoxPro, 4th Dimension, FileMaker Pro, PageMaker,
Borland C++, MetroWerks C++, Lotus 123, or Adobe Illustrator? Not available?
Oh, too bad. You don't need software because your computer multi-tasks.

Why don't you leave your fantasy world and join the real world? Amigas may be
wonderful, but they're a totally irrelevent niche machine that nobody uses for
any real work.

Egghead is going down the tubes. They are shrinking. First we would have
to find an Egghead store. (a friend was a manager of one and has seen the
company close many stores).

> Word 6, WordPerfect, Excel, FoxPro, 4th Dimension, FileMaker Pro, PageMaker,
> Borland C++, MetroWerks C++, Lotus 123, or Adobe Illustrator? Not available?

I can load and save almost all of those document and EPS formats. Plus
all my programs are registered and paid for. How many of those do you
actually have?

Excuse me but I do real work on my amiga. Should we compare my computer with
yours? Let's shall. 17mb ram, 2048x2048x256color graphics card with a 21
inch IDEX monitor. Another 15inch multisync montior, a 10baseT ethercard
with multiple network daemons running plus the multiple applications running
from PageStream 3.0 to ImagesMaster Professional and Art Department Professional.

My amiga is used for Advanced Scientific Imageprocessing and Analysis. It
is on around the clock for the past year. What is yours do? Any papers published?

Yes, and the pentium has a floating point division instruction for
double precision. It may not be the same as the PPC's but that
doesn't mean it is there.

Moral: Read, read, read. Learn about the Amiga before you post.
Learn the difference between cooperative "multi-tasking" and
pre-emptive multi-tasking.

Oh come on.... The Mac's multi-tasking is garbage. I hate using the Mac
when I need to get something done fast! The cooperative multitasking, or
rather, task switching, that the Mac employs is so good that they boast of
PRE-EMPTIVE MULTITASKING in system 8.0! Gee, isn't that what the Amiga had
in system 1.0? What? System 8 will be out in 1995 or 1996 and version 1.0
of AmigaOS was introduced in 1985? Wow, these Mac machines are really
cutting edge technology!!!! :>

Saw a review of Virtua Fighter on the Saturn the other night on the
'Gamesmaster' TV show here on UK TV.

What can I say .. The Jaguar is DEAD.

Atari , you had over a year to consolidate the Jaguar as market
leading technology but now Sega have got their 'next generation' console
out and it makes the Jaguar look _silly_.

Personally, I think DOOM is excellent. And Doom][is even better.
Its good for the Jaguar that its out, but it speaks volumes for Atari
that the Sega 32X version managed to beat it to market.

While I don't want to talk on Peter's behalf, let me tell you that
ATARI has said they are OUT of the personal computer market business.
To re-enter it will take far more than doing EXCELLENT with the Jaguar
, something they are not. They must fuel R&D in a Jaguar 2 if they
are thinking about survival. So how long will ATARI be out of the
Personal Computer market? 5 years?

True. Mac multitasking is a joke at best. I still remember
while doing rendering and on ANOTHER application doing a pull down
menu stuff... the system halts rendering. Neat eh?

I wouldn't call that multitasking.
Or let's say: "TRUE MULTITASKING".

>to user error. Concede that at least...

Then you look at where the error's come from and change it. New add-on designs identify themselves to the system & can configure themselves to fit in. Saying it was user error means admits that you have not designed for the human factor properly.

>no grumbles with MS - NOT AFTER USING ATARI SOFTWARE FOR SO LONG THAT
>HAS A MIND OF ITS OWN. The familiar bombs - the good old reserved vector
>error and whatever 35bombs meant..??!!

Most OS have trouble with unfortunate crashes. The Atari ones generally occur in exactly the same place each time. The Windows equivalent of a bomb out seems rather random in the way it appears, and is just as destructive - there is still no facility to restore the pre-crash system context.

>: Linux Mutitasks quite well... OS/2 does it too, or so I heard! But what

Sorry, but I've used an Amiga (first an A500, then an A3000) since the
A500 came out. I'll bet that unless you had an A1000, I've seen and used
Amigas for a longer time than you. I'm very aware of -exactly- what they
can do.

> pre-emptive multi-tasking as opposed to the cheesy cooperative
> multi-tasking which the idiots using the Mac think is great.

It works. It isn't perfect, but it works quite well.

> This actually shows up in printing, when the Mac has to interrupt
> a sound process to be able to send 3 letters to the printer.

It has to do with the limitations of the Localtalk port. Shall I start up
on a tirade about how little you know about the Mac?

> Check out Final Copy and Professional Page for high-quality
> 600 dpi post-script output within a few second.

Through the normal printer.device? What about 800 dpi? 1200 dpi? What
about if your printer supports something that the printer.device and
printer driver (PS driver) doesn't support, which is what the -vast-
majority of printers today do? In other words, unless you've got a
-perfectly- stock PS Level 1 printer, you're not getting the full
potential, when using Amiga drivers. That's a waste.

> Hint: Think about what you will write *before* you post.
> Not about what you had written *after* you get flamed.

Hint: Get a clue. I'm very familiar with exactly how the Amiga works.

>doesn't mean it is there.

Bad comparison. The Mac form of multitasking is a recognized, albeit
unknown, multitasking method. IMO, it is far better if apps are
written correctly. Pre-emptive can be bad if not done right, just as
co-operative can be bad if not done right.

neutron, I'm puzzled about you. When I try to finger you, I get a
'unknown host: metu.edu'. Are you forging, or should I finger
neutron@dartvax.dartmouth.edu? Also, you should take a logic course
whilst at college. Not digital logic, but the logic used in making
arguments. Your skill at such things leaves much to be desired.

>Moral: Read, read, read. Learn about the Amiga before you post.
>Learn the difference between cooperative "multi-tasking" and
>pre-emptive multi-tasking.

No need for quotes; co-operative multitasking is true multitasking,
just not your favorite method. You seem to have a problem with the
reality of things you do not like. It is not the Macintosh computer,
but the Macintrash graphing calculator. Not co-operative multitasking,
but co-operative 'multitasking' (trans. wants to be but is not). This
is known as the soldier reflex, for soldiers will call their enemies
Krauts, Japs, Ruskies, Commies, Ragheads, anything but humans. A
normal man cannot kill another; you cannot detract from a real

computer, but must instead put down what is already a toy. Either you have no faith in your skills of debate and must detract from that which needs no detracting, or you place computers at the same level as humans, and cannot 'kill' the worth-a-human, but can 'kill' the worthless toy.

This is true, although the last line is your opinion, which I will show is
imperfect.

> When you are playing a digitized sample on the Mac, moving around
> windows or loading an application will cause the song to be reduced
> to digestive noises; try this on the Amiga and see how the sound chip
> Denisse takes care of all this by itself.

This isn't true. I can routinely play MODs in the background while doing
many other things. I think you are not familiar with the Macintosh.
-Some- sounds will stop multitasking. Many won't. It depends on what the
application you are using to play the sound is made to do.

> 2) Workbench had a CLI which could be called from within the GUI,
> making it a perfect OS, both visually intuitive and functional.

For some people, it's nice. It also lacks a -lot- of the features of MacOS.
Command lines can easily be added to MacOS; scripting is also on the Mac
as AppleScript, a very elegant and easy to use *RECORDABLE* (on an
OS-level) language. It's also got built in help, so a "dictionary" is
available to tell you how to use all of the AS commands currently
installed. Nice touch.

> 3) The Amiga has always been a programmer's machine, since it is
> very interesting to be programming 4 different chips in addition to
> the the 68k.

And the Mac will let you do this as well, with neat chips like a DSP and a
PowerPC, neither of which the Amiga can really use.

> 4) Amiga users are serious people who can tell RAM from ROM unlike
> Macintrash idiots who post silly articles to USENET arguing that
> the Amiga is not a real computer.

Bear in mind this goes both ways; you apparently are not as familiar with
the Mac as you think.

>
> Mike Cohen: Learn about hard-ware before you post, bozo.
> You are only contributing to the negative image of the Mac
> user as a total idiot.

Likewise with the Amiga, although perhaps not to that extent.

Read what I read, and try to keep the niggling to a minimum. Your second
sentance (prior to the open-paren) talks about you not knowing what a PPD
is. My reading is excellent. Check yours.

> >I haven't said that. PS is nothing new, and it's about time the Amiga got

You aren't. Read what I said - PS is -nothing new- and it's about time
the Amiga got it in the OS. You question my reading skills but I'm forced
to conclude yours need work.

> Your mail bounces, and why should I email it anyway? Are you too lazy to
> read the newsgroups you post to? My newsreader won't allow me to email

My mail problems have been taken care of. You might try to find a better
newsreader; NewsWatcher 2.0b20 works wonderfully on the Mac, and lets me
send copies to the newsgroup, the person I'm replying to (you) and myself
with no extra work.

I'm not lazy, but there is a chance I'll miss your reply. I would
appreciate the courtesy of an e-mail reply.

> I strongly disagree.

Well, I've been in the position of having to devise a printer-independant
graphics display, so my perspective is undoubtedly different from yours.
I consider good support, if you can have both simple text and bitmapped
graphics, dumped to any printer which has a corresponding driver
installed. This would be a bare minimum, and at about the level of
Windows. The Amiga also has options for text, stuff like line spacing,
font size, etc. For graphics, I has auto-dithering and (I believe) color
correction. From the users point of view, you don't have to worry about
anything but installing the drivers. You print to that driver, it does
the rest. Regardless of resolution, page size, or pixel depth. The only
thing Windows has the the Amiga does not is the Print Manager, but this
only occasionaly useful.

> arrangement onto a basic page.

Like what? What exactly does PS level 2 require to be used. Although I admit I've had no personal experience with it, I believe the Amiga printer drivers will support pages up to 64kx64k in 24-bit. What more could you want? It's up to the print driver to use any special features the printer has to accomplish this, but In the end (with the exception of PS, that's all you need.)

I just looked at r.g.v.atari and r.g.v.advocacy, and from what I saw there it looks like the Jag is dead. Fewer than ten games out for it buy Christmas! The handful of games that are available don't meet anyone's expectations! Low sales at stores (not surprising considering the size of the Jag game library)! Lack of interest on the part of developers (the classic chicken-and-egg paradox)! A depressed user-based! Frequent delays by Atari!

This is NOT GOOD folks!

Especially since Atari was depending on the Jag to pull it out of the deep hole its fallen into the past 10 years.

And how is Atari going to make a comeback in the computer market against the likes of Microsoft, Apple, and IBM with a machine whose development is funded by Jaguar "profits" when the Jag itself is LOSING MONEY!!

I hope Atari has a rabbit up its sleave because otherwise it's all over; Atari will go the way of Commodore and Sinflop will have a big field day over it. Of course, without Atari to pick on Mr. Flop will lose is only reason to exist and will proabably promptly commit suicide in a fit of depression; but that's a different story. The story here is that Atari is in BIG TROUBLE and will have to act quickly in order to get out of it.

Note that this point, which is often posed by Amiga users, is just as idiotic as "Who really needs pre-emptive multitasking?" But Amiga users choose memory protection instead of multitasking because they happen to have the latter. In reality, they're no different than Mac users -- both groups deny, deny, deny.

For the same reason you should want preemptive multitasking, networking
support, or a good device driver model in an operating system: it's
a feature that makes a computer more useful and robust, even if it does
so in ways that are not visible to the average user.

What makes you Think Sega is shooting themselves in the foot. I have seen more 32 x and 0 Jagflops in stores. The Jagflop is a market failure. The rest of the world knows that..Do you?

4959. Re: Now that the Jag is dead, what will Atari do?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-12-02 02:04:01 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3blvah$ni9@nermal.cs.uoguelph.ca>
Source record: 14511

: I just looked at r.g.v.atari and r.g.v.advocacy, and from what
: I saw there it looks like the Jag is dead. Fewer than ten games
: out for it buy Christmas! The handful of games that are available
: don't meet anyone's expectations! Low sales at stores (not
: surprising considering the size of the Jag game library)! Lack
: of interest on the part of developers (the classic chicken-and-
: egg paradox)! A depressed user-based! Frequent delays by Atari!

Jag Games currently available:

1. Cybermorph
2. Dino Dudes
3. Trevur McFurr
4. Aliens Vs. Predator
5. Tempest 2000
6. Raiden
7. Wolfenstein 3-D
8. Dragon
9. Brutal Sports Football
10. Doom

That's ten right there! Expected before Christmas:

1. Kanasumi Ninja
2. Club Drive
3. Iron Soldier
4. Syndicate
5. Sensible Soccer
6. Cannon Fodder
7. Skiing
8. Bubsy
9. Zool 2

+ quite a few more that I can't remember offhand. The flow of games is
continuing into the next year as more 3rd parties complete their games.

Jags are selling briskly, Atari is advertising, and many 3rd party
developers are nearing completion of their games. While Atari could be in
a better situation, it's not as bad as you think.

: And how is Atari going to make a comeback in the computer market
: against the likes of Microsoft, Apple, and IBM with a machine
: whose development is funded by Jaguar "profits" when the Jag
: itself is LOSING MONEY!!

The Jag losses have gotten smaller and smaller by the quarter.
This quarter, Atari will likely turn a profit ... it is Christmas, you

know!

: I hope Atari has a rabbit up its sleave because otherwise it's all
: over;

A few rabbits:

- The cross-liscencing deal with Sega
- Primal Rage
- Williams Electronics can make Mortal Combat for the Jag in 1995
- The Jag network goes up
- The CD gets released, as do many CD games being developed by
3rd party developers that Atari's been waiting on to complete titles.
- The Jag VR helmet comes out.
- Fight For Your Life is released
- Atari introduces some new surprises at Winter CES 1995!
- Ultra Vortex & Rayman are released.

Atari will go the way of Commodore and Sinflop will have a
: big field day over it. Of course, without Atari to pick on Mr.
: Flop will lose is only reason to exist and will proabably promptly
: commit suicide in a fit of depression;

Ahh ... we can only hope!

Read the posts a little more carefully next time. If you looked
carefully, you'd see that things aren't as bleak as you think.

I have been following this haggle-marathon for a while now, and I have to profess that I don't understand what the brou-ha-ha is all about- as I understand it, the organization that has been manufacturing the Amiga (with the exception of a few small groups) has gone bust. I think this brings the development and production of new machines to an end, so why aren't the Amiga fans arguing about what new platform to move to instead of whining about the Macintosh (which is selling OK in the face of the Intel-Micro$oft onslaught). Why not buy a cheap Pentium(tm) machine, and get something new to carp about, eh? Then you can port all this Amiga stuff over to comp.sys.intel, and bore them with how great the Amiga was.....

Carpe per diem!

Huh? How did you see this?

|>Fewer than ten games out for it buy Christmas!

There are 10 games available for it right now. Expect to see more before X-mas.
I guarantee there will be at least 2 more, but I expect 5 to 8, and more are
possible.

|> The handful of games that are available
|> don't meet anyone's expectations!

Jaguar games have been recieving very good reviews on the average.
- Cybermorph is a tad unimpressive, but not bad
- Trevor Mcfur sucks (It was just a graphics demo for the Jag,
but was impressive enough that they decided to release the system early),
- Dino Dudes is a puzzle/Lemmings game - 'nuff said
- Raiden is a terrific port of the arcade game
- Tempest 2000 is the best game to come along for any system in quite some time
- Wolfenstein 3D is a very good translation
- Aliens vs. Predator is a smash
- DOOM is as good as the PC version, and in some ways better
- Brutal Sports Football is fun, but unimpressive. Done by a bad developer
- Dragon is unspectacular, but not a bad game. Just average.

|> Low sales at stores (not surprising considering the size of the Jag game
|> library)!

Sales have been doing reasonably well, thank you. Outselling 3DO in the U.S.

|> Lack of interest on the part of developers (the classic chicken-and-
|> egg paradox)!

Actually, there is quite a bit of interest from developers. More signing on
by the day.

|> A depressed user-based! Frequent delays by Atari!

Just a bit peeved that the games are taking so long, but I think you'll find
that the majority of Jaguar owners are quite happy with their purchases.

|> And how is Atari going to make a comeback in the computer market
|> against the likes of Microsoft, Apple, and IBM with a machine
|> whose development is funded by Jaguar "profits" when the Jag
|> itself is LOSING MONEY!!

Actually, Atari could turn a small profit this quarter (on the range of 3 cents a share)

|> I hope Atari has a rabbit up its sleave because otherwise it's all
|> over;

They do :)

|> have to act quickly in order to get out of it.
|>

Well, you're right about that. Atari has a chance to make it big right now. Public support of the Jaguar is growing - media has been giving it good reviews (see recent Washington Post, today's Good Morning America, etc). However, if Atari does not get the software out, they will not be tremendously successful. This is not to say Atari will die; they will fill a small niche market, but will not take over the video gaming world. They can gain a large share of the market if they do things right. They have several sure to be smash games on the way in the next month or so (Iron Soldier and Fight For Life, along with the third party Rayman, and others), and more games coming out before X-mas (Checkered Flag, Club Drive, Sensible Soccer, Val d'Isere Skiing and Snowboarding, Syndicate, Theme Park,... they've been on the production line for a while now). The next few months will be crucial for Atari. They can either become a big power in the industry, or just one of the smaller players (like 3DO is facing, and Nintendo may become if they aren't really careful). Atari won't die any time in the near future.

You must have been reading too much of Sincrap's stuff (and BTW Sincrap, I like Apple). :)

Unfortunately, he's probably right. Have you read r.g.v.atari and
r.g.v.advocacy lately? They're full of forcasts of doom and gloom for
the Jag, and not all of them are eminating from Iowa. Let's face it.
It's over.

As for Gavan having Sinclapitis, how could that be when his posts are well
edited and grammatically correct.

*

Since people have felt the need to write at least half a dozen PD
programs to "play sound in the background" on Macs, I assume this isn't
default behaviour. Also, the system beep seems to definitely stop the
machine; or so it seemed when I got the bright idea of sampling CDs for
whimsical warning beeps -- even a three-second sound drives you batty
with program lockups. The longest that seemed tolerable was a simple
"Yee-how!" from Bjork :)

Oh, yawn. NeXT machines, which have _memory protected_ pre-emptive multi-tasking (among other OS features which Mac, PC, and Amiga users would love to brag about) also used DSP chips to handle their audio back in 1988. Stereo CD-quality sound back when Multi-Media was just starting to buzz.

> 2) Workbench had a CLI which could be called from within the GUI,
> making it a perfect OS, both visually intuitive and functional.

Yawn again. Most OS's are still stealing NS's GUI features, and its GUI/CLI interfaces are very well integrated.

> 3) The Amiga has always been a programmer's machine, since it is

I won't even comment on this one.

> 4) Amiga users are serious people who can tell RAM from ROM unlike
> Macintrash idiots who post silly articles to USENET arguing that
> the Amiga is not a real computer.

Which is why Amiga users are still suffering from an identity crisis and have to state things like 'Amiga users are serious people...' and '...arguing that the Amiga is not a real computer'?

> I cannot stand it when some blithering idiot, especially one who
> is stupid enough to use a Mac criticizes the Amiga.

Many people use multiple OS's daily and learn to live with each one's idiosynchracies, and put up with each platform's manic advocates. I have nothing against Amiga computers, and admire some of their pioneering features. Why does it seem that Amiga _advocates_, however, usually come across as insecure fanatics who boast about tiny features as if they are the most important things in the world, and resort to juvenile name calling and penis comparisons when in fact they are simply talking about

computers for god's sake?

> Gavan, I'm shocked. You used to be intelligent. Guess you caught Petey's
> Disease. Sigh. Sinclap claims another victim.

Sorry, but I stand by my post. Right now, the Saturn isn't scheduled to
leave Japan until next year but if Sega see their market falling in
the US and Europe, they WILL start shipping outside Japan. Nintendo
did that with the SNES here - they brought it in a year early since the
Sega Megadrive was butchering the NES.

The point is that the Saturn _exists_. It works, it does everything
they said it would and it already has some stonking games. The Jaguar
although potentially good has been out for over a year and theres not
a lot of software for it. What there is is largely unimpressive apart
from maybe Doom and Aliens vs Predator (which hasn't really lived up
to the pre-release hype).

The same program also showed a preview of the Sony PSX due out within
the week. WOW! That machine makes the _Saturn_ look silly! The video
of the games looked frankly unbelievable yet by all accounts it does
exist and will cost (when released in the UK) only slightly more than
a Jaguar does right now.

NOt pentium because of the BUG. I was going to buy a multi processor
Pentium... Well, guess what, after the descovery of the BUG, I decided
to get myself a DEC AXP running WinNT. I personally do own the Amiga\
(VT4000 and LW3.5), and I will agree that WB3.0 is an excellent operating
system and support is still strong, but at the same time I would
definitely not put much $$ into it unless CEI or C= UK buys them and
performed a miracle.

Very average - was out on the Amiga _years_ ago.

> - Raiden is a terrific port of the arcade game

But its just a port of a very old arcade game.

> - Tempest 2000 is the best game to come along for any system in quite some time

Another port of an old game. Very good, but unlikely to fire the public
imagination.

> - Wolfenstein 3D is a very good translation

Wolf3d is old news, especially with DOOM out.

> - Aliens vs. Predator is a smash

Nice, but not nearly as good as people were hoping. It is very slow
and was also months late.

> - DOOM is as good as the PC version, and in some ways better

Not as good as the PC version, but the best console version to date.
Suffers from the limitations of the console format. Was beaten to
the shops by 32X Doom - a game for a machine that had only been out
for ONE WEEK.

> - Brutal Sports Football is fun, but unimpressive. Done by a bad developer

BSF was a fun but average game. Its sad that the Jaguar is so starved
of software that people were making a big deal out of this game.

> - Dragon is unspectacular, but not a bad game. Just average.

Yep, its not that great on ANY format.

>
> |> A depressed user-based! Frequent delays by Atari!

Nope, not actually. I would like to have memory protection on the
system. I think multitasking deserves a better priority, because
usually when you really benefit from benefit protection is when
you are multitasking :-)

Don't stereotype users.

OK, let's see. I bought my A500 7 years ago, I programmed and worked
on that environment since then. It has always been a good way to
work when away from UNIX, without having to make a fool of myself using
a Macintrash.
Sorry bozo, you hit a hard one this time.

> > pre-emptive multi-tasking as opposed to the cheesy cooperative

>

So does the FDIV instruction in the Pentium FPU.
Time to face it bozo: Your "system" (don't forget quotes here)
cannot multi-task unless the individual applications agree to do so.
It is very easy to interrupt processes by doing simple things
such as opening the pull-down menus. As for applications like
Sound Tracker that try to overcome the problem by setting up the
interrupt level very high, they run into a nice mess when a higher
priority interrupt (such as network, TPC/IP connection) is
invoked.

> on a tirade about how little you know about the Mac?
>

I am typing this from a Quadra 605 bozo. Sometimes I have to use
a Macintrash out of necessity, although to avoid puking, I
always telnet to the nearest UNIX server and run ULTRIX via
a terminal emulation.

>

>

Yes, ofcourse throught the normal printer.device bozo, what else
could it be? You only need to get the appropriate printer drivers,
and trust me, they are abundant out there. Printer drivers are
hardware-specific bozo: they are written for a particular printer.
So if they are written well, they will obviously support that
particular set of extra capabilities the printer offers.

Nice try bozo. Try again.

Ten carts with only about 4 good games (AvsP, DOOM, Wolf, Tempest).

And that's in one year. I believe more titles when I see them, but
it might have a chance.

What do you mean by default behavior? When you call the routine to play
sound on the Mac, you set one of the parameters to tell the OS to either
play synchronously(sp) (where it doesn't give up the cpu until the sound is
finish playing) or async (where it does give up the cpu).

>First you'd have to find someone remotely interested in the OS or in merging.

Apple pays for the port of MagiC to the Mac 680x0 machines. MagiC is an
Atari compatible OS. No interest here, I guess.

>Even SoftLogik has pulled out of the Atari market. (There will be no PageStream 3 for the
Atari.) However they have announced development of versions for the Mac and Windows.

1) If the line above has been cut to 75 chars per line due to a faulty
editor, i don't want the machine this editor runs on.

2) The Atari market misses PageStream oh so much, a third DTP package that
doesn't compete with DA's Layout or Calamus SL is what the Atari market
really needs, indeed. The Windows version of PageStream will soon
(Win'95) have to compare with Calamus NT, though the WinNT version does
still not support softRIPping. And Calamus SL will compete with XPress in
the Mac 680x0 market in the near future. Take it as a fact: the Medusa
T40/T60 were not aimed at the _Atari_ market, they were aimed at the
Calamus market.

I think this document will enlighten you :)

The operating system for your Brain. Which One???
==

Windows for brains:
You think about one of any number of things at anyone time but
only for a short amount of time because then your mind goes
blank as you encounter a "general protection fault" and as a
last resort you have to re-boot your brain.

DOS for brains:
You only think of one thing at one time, and can't remember
anything else you were meant to be thinking about. You think
only in words and never any pictures.

Unix for brains:
Wow - you can think of lots of things all at once until your
brain runs out of sockets. You can only talk though with people
who have brains made by the same vendor. Unfortunately you
also never make any sense and have to read manuals to learn
how to think. Predominantly a random thinker.

CP/M for brains:
A very slow and old fashioned thinker. Any thing you
remember has to be less than 3 letters long.

MVS/CICS for brains:
You have a very big and expensive brain. You can think about
many things at the one time but never now what other parts of
your brain are thinking unles you have set up SNA connections
between sections of your brains. You also need an army of
system programmers to define what thoughts you may and may
not have.

OS/2 for brains:
You can think about lots of things at once but need the
equivalent of eigteen sets of encyclopaedias in memory to
produce any rational thought. No-one supports your way of
thinking and many laugh at you whenever you speak.

Mac for brains:
Simple thoughts for simple people. Thinking that looks good,
feels good but is expensive.

Pick for brains:
I now narthing. Narthing Mr Fawlty.

AmigaOS for brains:
You can think of lots of things at once, even with a very small
memory. The trouble is that, sometimes, one thought starts to
think about the things another thought was using. This leads to a
compelling need to wrap a teatowel around your head and sit,
crosslegged, on the floor.

Linux for Brains:
You can think of any number of things and not run out of sockets.
Unfortunately, there is no support for your particular limbs,
ears, mouth or .... thingy.... available yet so you are reluctant to
change over at this stage.

>ST's last "stronghold" (and I use that term loosely), the ST is dead.

Ah yes, and the computers on the 'Mayday' Techno festivals were fakes, just
as the computers used for the music productions of Prince, Jean-Michel
Jarre, Madonna, etc. are. This _IS_ a niche market, but it exists.

And of course XPress is better than Calamus SL, that's why Thomas
Tempelmann (MagiC for Mac author) had so many XPress users around him
during every presentation of this emulator.

Thorsten - who doesn't use the term 'dead' on any computer that still has
it's newsgroup.

: > Denisse takes care of all this by itself.

: This isn't true. I can routinely play MODs in the background while doing
: many other things. I think you are not familiar with the Macintosh.
: -Some- sounds will stop multitasking. Many won't. It depends on what the
: application you are using to play the sound is made to do.

This is not raelly ment as an ad to the discussion but anyway -
here's a little puzzle..

When playing a MOD form the Mac-side of my Emplant/Amiga
setup (and please, don't start hazzeling about how the
Emplant is super Mac-unfriendly - the same happens on
our Q840AV setup and the player may be to blame - but try
to explain it in an orderly fashion)

.....whenever moving the pointer, the music jumps around
aswell. The interesting bit is that when I flip back to
the Amiga-screen, the jumping stops when moving the pointer
even though the mod is still playing from the Mac side...

Cheers...

Because without memory protection, one application can walk all over another's data, possibly ruining a day's work.

Memory protection is desirable, if for no other reason, because it makes _development_ easier. The quality of one's development environment has a direct effect on one's ability to produce good software.

(By the way, I'd argue that the Mac operating system is no less robust than the Amiga's, but then we'd end up with hundreds of people chirping in that they've run their Amigas continually since the dawn of time with hundreds of users dialed into their bulletin boards while they were playing a MOD and generating the graphics for the next Star Wars movie (with NO SLOWDOWN, of course) and that they've never, ever experienced a crash, so I won't).

A well written program would not do this. It will always check to make sure
it is working with a valid pointer to a memory area that it is the sole owner
of. Ofcourse, Macs may need memory protection just to keep the poorly written
programs running.

>

How? I use enforcer which uses the MMU to detect illegal memory reads and
writes while I am programming. But that is only during developement, a
normal user still wouldn't need a MMU.

Grow up; the simple truth is that bugs occur in software for every
platform. If you think Amiga software is somehow exempt from memory-
corrupting problems, you're living in never-never land.

Besides, memory protection also prevents a program from maliciously
accessing another's data and comes almost for free with virtual memory.

>How? I use enforcer which uses the MMU to detect illegal memory reads and

Does enforcer guarantee that you'll catch everybug in your software?
I doubt it.

Except, there are times when the Mac doesn't multitasks and simply locks
up due to a piggish program. It's not multitasking at this point.

You say, either it multitasks, or it doesn't. In practice, it does
both, but since you want the bottom line, the answer is no, it doesn't.

A well-written program also allows a cooperative system to multitask
smoothly. So what? Pre-emptive multitasking and memory protection exist
because in reality the number of "well written" programs is small.

Imagine how idiotic a Mac user would sound if they responded to your
multitasking criticisms with "Well written programs cooperate just fine."
That is how idiotic you look to those of us who have both memory protection
and pre-emptive multitasking (and working virtual memory, and secure,
journaled filesystems, and..).

I would have to disagree. My data is the most important thing to me.
Memory protection is a mechanism to protect my data. Evan a mem-protected
cooperative system is preferable to a multitasking system with no
protection (in fact, exascerbating the problem). If your data is less
important to you than juggling multiple programs at once, that's your
preference, if, IMHO, not a particularly logical one.

Then again, I have both, and then some. If I had to give up one,
I'm not sure which it would be, despite the above.

By that rather silly definition, no single-processor machine multitasks
because at some point it's going to be have to run interrupt handlers
and other code that don't get preempted.

The bottom line is that the Mac multitasks. It may not do it the way
you like or as effectively as other operating systems, but it does.
Period.

Find a new mod player. And, from another of your posts: the Mac does not have memory protection in MacOS7.5; from a post of yours it looked as if you though it did.

: A well-written program also allows a cooperative system to multitask
: smoothly. So what? Pre-emptive multitasking and memory protection exist
: because in reality the number of "well written" programs is small.

Preemptive multitasking puts the responsibility of scheduling in the
hands of a single party. It's a matter of optimization, not correcting
a mistake. True that it can also prevent an appliaction that hogs up
the CPU needlessly from doing so, but the idea is that the OS (and the
user or sysadmin) knows better how to schedule multiple processes rather
than the individual applications.

I do think the programmers of an application should know what memory
addresses their program is writing to.

: Imagine how idiotic a Mac user would sound if they responded to your
: multitasking criticisms with "Well written programs cooperate just fine."

I obviously disagree with your lumping preemptive multitasking with
memory protection in this way. Memory protection exists to protect
against mistakes in programs or hostile programs. A system running
well-written programs (aside from viruses) would run optimally without
memory protection since memory protection would provide no benefits and
only a performance loss. On the other hand, the system could still
benefit with a change from cooperative to preemptive multitasking.

In reality however, I do value memory protection because of the reason
you gave. Particularly in a multiuser system - the more users, the less
trust I have in the stability of it. The price of memory protection also
continues to decrease as hardware performance increases.

I would say it's obvious they hope to get former Atari owners to buy their hardware. There is no way that Apple is even remotely interested in making TOS a primary OS for their platform; that would be a massive downgrade for them. Get them to buy a 630-series machine, and later sell 'em a PowerPC upgrade card once they've figured out the Mac OS is a more elegant environment (my opinion) to work in, and that $500-600 extra gets them a 66 MHz 601 with 1 MB of processor cache.

> 1) If the line above has been cut to 75 chars per line due to a faulty

No kidding. Who else would buy a severely overpriced chunk of 680x0 hardware that runs an obscure OS? Fanatic individual users with loads of cash, maybe, but the main market has got to be people who use the only piece of software that was ever a compelling reason to use the Atari in a business setting.

Well, you could shop around in comp.sys.amiga.marketplace if you want
to get something used. Getting them is a bit dicey, with CBM's lapse of
payments to Xerox (the patent license for using a pointer or somesuch,
something that everyone from SGI to Apple still pays for), the other
alternative is to get one mail-order from Canada. Pick up a copy of
AmigaWorld, still available at better newstands.
There is the hard fact that the Amiga is in limbo at the moment with
the snails pace the lawyers are going at in the Bahamas. I can say that
getting to know how the Amiga works both hardware and software greased my
introduction to the Macintosh and (ugh) Intel clone machines. In a few
months, I've become the senior technician at the service bureau where I work.

> >> Mark <<

Sinflop must be living in a really hick town if he hasn't seen any Jaguars.
I live in leduc, alberta, canada of all places, and I can find a jag!!
Several, in fact! Either that, or he is avoiding stores that advertise
it, so he can say that he hasn't seen any.

Now 32X on the other hand, I haven't seen, apart from the commercials.
Of course, I probably will eventually, but right now it just isn't here.
Sorry petey.

I don't understand why people are prancing all about saying things like
"now that atari's jaguar is dead", what are they talking about? Okay, sure,
let's sell the jag off now that it's finally getting some games- gee,
that makes a lot of sense. They've still got plenty of time- even if the
worst happened and NO games came out for christmas (I'm really stretching
here now), they've got enough games right now to sell the system. How
many games does the average gamer own? I know that most of my friends that
have gaming systems own perhaps 3 or 4 games- most of them they rent. The
games that are available right now are enough to tide anyone over until the
new ones are out (remember, this is all in the worst case scenario- if no
games came out this christmas), which would be pretty darn fast.

Anyway, it's looking like there were be several more available before
Christmas. And perhaps the CD in limited quantity. Hmm is petey still willing
to wager that the CD will never see the light of day? I doubt it.
None-the-less, he will continue to attempt to spread a negative cloud of
doubt over any atari product or attempt at marketing.

Face it peter, atari HAS gotten better. Even you have to admit that
somewhat. Losses are down. Sales are up. They've won lawsuits. If this
were any other company, you'd probably be optimistic.

I still maintain that the Jaguar is going to keep atari alive for a long
time to come. Petey will be arguing against atari until he is old and
grey (this is of course, assuming he is not already).

Hey Markflop. what does the 32X have to do with the Jagflop. I am not hear to defend Sega and is not concern about the 32x which is apparently selling well here in this side of the Atlantic..

Basically memory protection can make a machine much more stable.
If many people are using the machine (networked), it would be much harder
for one person to crash the machine. Also when a task dies, right now on
the Amiga we lose the memory until we restart. With memory protection
we could kill processes much easier, and get the memory back.

One error though, the Mac doesn't have memory protection AFAIK.
It seems to be set up in a way that should make it fairly easy to add
(each application has a allocated amount of memory). The way the Mac
does memory allocation is an annoying feature, but works. For someone
like me that switches between doing large and small projects, I think
a dynamic system would be better. But either way this is memory
management, not memory protection. some of the UNIX machines in the
building I work in have not gone done in 118 days, and they are used by
many people. That speaks for itself on why memory protection could be
a good thing, but perfectly written programs would be the best.

Hey Sinflop (to continue the trend), what side of the Atlantic are you on again?
Here in North America, the 32flop and dozens of copies of cart are just sitting
there on the shelves, in the display cases, etc., and nobody ever moves them. It
is selling some, but so far it is much more of a flop than the Jaguar has or will
ever be. OTOH, the Jaguar is selling quite nicely.

Serious question: how the hell do you do this? We're currently digitizing video (talking-head video where 90% of the picture is basically immobile), and using Cinepak compression and VideoFusion with a PowerMac 6100AV, we're getting about 10fps in the absolute tiniest size ("One-Quarter", or 120*160, I think). Moving up to "Three-Eighths" gets even slower, but at least has some detail. This is QuickTime 1.6.x, and I don't see any way to speed it up (I compared "Best" to preset frame-capture rates of 15, 10, and 8fps, and "Best" and "15fps" didn't play any faster than the "10fps", so I went back to using 10fps).

>hardly small and fast *or* large and slow.

No, "small and slow", from what I can see :)

>$800 for a 25MHz LC040) you can get 320x240 at 30fps or 640x480 at 15fps.

On which planet? Sorry, but nothing would make me happier than anything even vaguely approaching those rates (now that we've told Those That Control The Funding "sure, we can do digital video on these things" and they presumably have the usual expectations for the word "video"). What's the trick?

Yes, capturing to RAM rather than the hard drive speeds things up somewhat, but still nothing like these quoted speeds -- I think in RAM I was managing maybe 15fps or so in 120*160, since if it was any faster, it would have been indistinguishable from Video Monitor, and it was certainly noticeably jerky. Also, a 16-meg machine doesn't hold much captured raw-video, so this method isn't really useful. Would it help to capture or play back in only 8 bits? VideoFusion seems to only want to capture 16 bits, and its files look really bad when played back on 8-bit screens (as if they had only 4 colours total, badly dithered).

Serious question #2: is it OK to install a newer version of QuickTime onto a system that didn't come with it, or does this violate Apple licensing? (ie. can I grab QuickTime 2.0 from my 7.5 system at home and stick it on the 7.1 machines in the school lab?)

Capture is WAY different from playback. Mainly because compression is much more expensive computationally than decompression, particularly with motion video compression algorithms. If you switch to doing post-compression on your recorded video, then disk I/O becomes the big bottleneck.

I have a Quadra 660AV with a hard drive capable of sustaining over 3000 KB/s. Using VideoFusion in post-compress mode, I can get a capture rate of 20 fps at the 3/8 size (I think that's 240x160). Theoretically, I could get about 27 fps at that resolution, but it has to record sound too. That frame rate results directly from how fast my hard disk is, and nothing else - not QuickTime, not the video hardware, etc.

To do full-quality video capture, on any machine, you pretty much have to buy a large expensive chunk of hardware that does real-time video compression. The video capture on the AV Macs is really for watching TV with (for which it does fine), experimenting with video capture, or networked videoconferencing (which has to use a tiny window anyhow, due to bandwidth limitations).

Playback, not capture.

> if they had only 4 colours total, badly dithered).

Even if you set your display to 8-bit mode, the capture will take place in 16-bit color. The Macintosh AV hardware splits its VRAM in two: one half is used for the motion video frame buffer, and the other for the graphics (computer) frame buffer. The pixel depths of these two buffers are independent: you can be in 1-bit B&W mode, and still have the video playthrough show in 16- or 24-bit color.

I don't think there's a way to get QuickTime to make a true 8-bit movie. Most (all?) video compression algorithms are to some degree similar to JPEG, and thus require that the pixel data be in the form of RGB triplets rather than an index into a CLUT. So 16-bit is a practical minimum, with dithering to support playback at lower bit depths.

> Serious question #2: is it OK to install a newer version of QuickTime

I don't think so. I know that Apple has not put up QT 2.0 for public access at their FTP sites.

If you get site license pricing, 7.5 is pretty cheap. I got my copy under the volume site license program; it was $25 for a CD, a set of floppies, and no manual (who needs it?).

BTW, if you have the CD version of 7.5, check out the QuickTime movie "INFOBAHN," which is somewhere on the disc (just use command-F from the Finder to find it - I can't remember where they put it). This is a bit less than 320x240 resolution, but it is a 30 fps movie. QuickTime 2.0 does just fine playing it at full speed on my machine.

Well I have an Amiga and Emulate the MAC and it can do 120*160 in about
15 fps. And that's on an emulation,the rate increases with a REAL MAC
and then inceases again when you get a faster MAC. :-)

: >QT's Cinepak performance has
: >continued to increase with succeeding versions, as has the data

: the trick?

You know I have to agreee with you there are a few flaws in the playback
rates stated above. ONE IS: 320*320 at 30fps or 640*480 at 15ps, now
correct me if I am wrong (which I'm not) but 320*240 is only a quarter
of the size of 640*480 so this goes to say that a 320*240 anim would be
4 times faster. This was not the case above. Another thing was that
the amount of colors was not qouted, and that is an air in itself.

: Serious question #2: is it OK to install a newer version of QuickTime
: onto a system that didn't come with it, or does this violate Apple
: licensing? (ie. can I grab QuickTime 2.0 from my 7.5 system at home and

Yes you can if you buy the version, or upgrade your system software which
you should do anyway. Get a hold of QT 2.0 it is much better at playback
than previous versions.

No, the Medusa, being imported by Lexicor, is also used for running their
software. It makes a wonderful Graphics & Rendering engine.

Not really. A PowerMac or Pentium offers higher CPU power at a lower
price, as far as I know. A 33 MHz 040 doesn't compare to a 60 MHz 601 or
Pentium, especially in FP performance (which is the most crucial for
rendering).

The real problem here is the lack of memory protection, not the lack of
preemptive multitasking. After all, if memory isn't trashed, then you
can force-quit the buggy application, since interrupts are still
working.

Uh, what if I don't *want* to quit the program. If I'm running a piggish
program, I may habe a good reason to be doing so. That doesn't change the
fact that the system then becomes about as useful as a locked box in case
I *do* need to use it.

It doesn't happen too often. :-) Actually, to be serious, if you use single-precision FP, the bug isn't there (it only applies to double precision). As far as I know, rendering doesn't require really good precision (somebody please correct me if I'm wrong).

If you run into the bug, you effectively get single precision results.

In any case, the PowerPC 601 would be faster. Once the FP pipeline is full, it can complete single-precision FP instructions at the rate of one per clock cycle, and double-precision at one per two clock cycles. Very fast FP.

How would you know that the stock is sitting there all day? Do you hang out in
the store in its entire business hours? How many stores have you been to? I
will wager that 32x sales will exceed Jagflop sales. No challenge there..
It's pathetic that Apple can sell 350,000 Mac 630's since last September(3
months ago) and Atari can sell a $250 console.

: Hey...,Who cares... How do you know what the status of the 32x is? Will have
: to wait until Christmas is behind..

Obviously you do, Sinflop! Otherwise you wouldn't have started
this thread! I'm using your logic. You claim the Jag is a flop because
you can't find it in any stores. I'm claiming that the 32X isn't a
success because I see dozens of 32X boxes gathering dust in the local stores.

: Oh, Christy he has not found a hole. He is assuming that the 32 X has sold
: poorly with out evidence. I understand it's the opposite. Will have to wait
: after the holidays for the truth.

Hey Sinprick ... dozens and dozens of 32X boxes that haven't
moved in a month certainly qualifies as evidence. Statements from several
clerks that the 32X is selling well is evidence. Where's yours?

Having now used Papyrus for about two weeks I can safely say its worth EVERY penny. While it may not offer all the functionality of certain PC apps, it does offer LOADS of features and a very nice output. I can even get an excellent printout off my humble Star LC10.

Now just for a change why don't people BUY something rather than PIRATE it. This especially applies to students (like myself) now if you order it from Hi-Soft, you'll get 30% students discount. Now you cant say fairer than that!

I'm going to get flamed for this (and the flaming will prove my point), but:
Sometimes I get really tired of my fellow Amiga users. To argue that Amiga
don't need MP because Amiga applications would be better programmed than
applications in average is so OBVIOUSLY wrongheaded. Ever now and then you
bump into a program that corrupts your memory and smashes the OS, especially
if you're using a lot of freeware programs (as I am). Under the years, these
programs have added up to a not insignificant number. If we had MP in AmigaOS,
these programs would never even been released, since with MP, they wouldn't
have run in the first place - at all.

In a lot of cases, MP FORCES you to debug your software. Period.

>Besides, memory protection also prevents a program from maliciously
>accessing another's data and comes almost for free with virtual memory.

Besides? I thought this *was* what it did :)

>>How? I use enforcer which uses the MMU to detect illegal memory reads and
>>writes while I am programming. But that is only during developement, a
>>normal user still wouldn't need a MMU.

Sigh. Enforcer does not protect all of your memory. Enforcer is NOT the same as
MP. And haven't you noticed that there are quite a few developers out there
who STILL don't use Enforcer? Even commercial ones (if there are any left :( ).
Again: With MP in the OS, these people would be FORCED to debug their
programs (at least with regard to memory bugs outside the programs own
memory area (always pays to be careful about what you say, lest you get
flamed :).

>Does enforcer guarantee that you'll catch everybug in your software?
>I doubt it.

NO software in existance does THIS :)

>Jim Wong (jd-wong@uiuc.edu)

(The reason I'm probably gonna get flamed is that a lot of Amiga users
ARE insecure, and would like to close their eyes to ANY drawbacks and
shortcomings in the Amiga. It doesn't make the shortcomings go away,
and it leaves the rest of the world with the impression that Amiga users
are immature and fanatic.)

For once, a good idea. Maybe that is the case in your area, but back home in Maryland (at a Babbages, an EB, 2 K-Marts, 2 Wal-Marts, and 2 Kay-Bees in MD and PA), and here in Cambridge/Boston (at an EB, Caldor, Lechmere), the 32X is selling very, very poorly. The Jaguar is selling nicely. It has puzzled me how for months you have said that there are no Jaguars in the area - where are you? I live in the middle of a very rural area (we call it Carroll COWnty), and can find Jaguars in 6 stores within a 45 minute drive.

> I doubt it.

Did I say that too? "I doubt it." I will quote what you misread, "use enforcer
which uses the MMU to detect illegal memory reads and writes while I am
programming." This sentence was in your post but you didn't read it. I never
said, "catch everybug in your software?" These are your words. You like to change
the issue like it is a moving target. I can provide you with tools that will
catch many bugs in your software but almost never all. The original issue was
why should a MMU be used. You said memory protection and help during development.
I showed you a tool the amiga programmers use to do just that and you don't
admit your wrong but change the issue to "catch everybug in your software?"
Show me the tool on the mac that will "catch everybug in your software?" and
I will be very impressed.

I use Macintercomm for my terminal program and Fetch to ftp. These
programs always work in the background no matter what other task is
running. This is true with many programs that use the Time Manager to
get CPU time instead of the Process Manager.

|>
|> Let's not. Either it multitasks or it doesn't. I can play a game while
|> simultaneously unstuffing a file, printing a document, and doing a 57kbps
|> FTP over AppleTalk. Therefore, the Mac multitasks. QED.

Depends on the game. The real problem with co-operative multitasking lies in the fact that the burden of scheduling falls implicitly on the application. In your event loop, if you do not make calls to wait for the next event, then your task will hog all system resources. In a priority based, pre-emptive multi-tasking system, a high-level interrupt, almost always the clock interrupt, gets handled and the OS looks at the currently running task to determine whether it is the highest priority task in the ready to run state etc etc. The point is, the task does not even need to know about task/process scheduling. It all works as if by magic...;^). To be perfectly fair, it is all too easy and common in the Amiga arena for a game to take over the whole machine and essentially kick out the OS. On the Mac, one game that will take over the machine and cause other tasks to fail if they depend on timely service of interrupts is Eight Ball Deluxe, a pinball simulation.
|>
|> If you want to argue the shades of gray concerning how well it multitasks,
|> then let's not use misleading, emotionally charged terms. Let's say:
|> "PREEMPTIVE MULTITASKING" and "COOPERATIVE MULTITASKING".

Yes. But for another data point, people who have used UNIX workstations with the overhead of X-windows and say Motif window managers typically have a real difficulty going over to a Mac in a networked environment because the lack of pre-emptive multitasking shows up regularly in such an environment.

You are missing the point completely. You can never catch every possible
bug, even with your vaunted Enforcer. Doesn't it make sense, then, to
protect the user from those that slip through?

5050. The Sinclap Who Stole Christmas!

Newsgroup: comp.sys.atari.advocacy
Date: 1994-12-05 21:20:11 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3c006b$kat@nermal.cs.uoguelph.ca>
Source record: 14357

It was Christmas Eve in a little town called Jaguar-ville. The residents were happily putting decorations on the tree and playing happily on their Atari Jaguars. There was much singing and rejoicing as everyone prepared for the festivities. Children gazed longingly at the wrapped presents under the tree and visions of fuji's danced merrily in their heads. Songs were sung, aliens were blasted and everyone was happy. Well ... except for one person.

High atop a mountain over-looking Jaguar-ville, sat the evil Sinclap. He scowled at the happy town and tapped his feet in dismay. You see, Sinclap was a bitter man.

Long ago, he was a normal human being. Going by the name of Peter Sinclair Day, he looked human, sounded human, and even spoke like a human. But that was before the fateful day that changed his life.

You see, Peter had trouble fitting in with the other children. They laughed, called him names, and wouldn't let him play any Atari games. Peter tried to fit in, but seemed to be hindered by a socially-inept personality that had plagued him from birth. Peter liked Apple Computers.

While Apple computers were fine machines, they were always vastly over-priced. As a young boy of about 12, Peter tried to defend his purchace of a Mac512 for $2000 when an Atari ST was available for $500. As the ST offered the same features for a quarter of the price (as well as color and a MIDI port), Peter was laughed at and beaten up by the other children on a regular basis. It didn't help that his heralded company had tried to sell their vastly inferior Apple IIc for almost twice as much as an Atari 1040ST.

As Peter entered teenhood, he became more troubled. It seemed that Peter couldn't get a date to save his life. All of the girls of Jaguar-ville (his sister included) remembered Peter's idiotic statements and refused to go out with him. Peter became bitter.

One day, while trying to satisfy his sexual urges by utilizing the disk drive of his precious Macintosh, an event happened which changed Peter's life forever. Jaguar-ville was hit by a powerful electrical storm which caused incredible power surges throughout the town. Peter, with various apendages lodged in the disk drive, took a direct 220 volt electric charge and was mutated into a hideous creature. The Macintosh became fused to Peter's private parts and he was suddenly able to transmit messages to cyberspace that were of the same quality as the materials which formerly came out of that area.

Fearing the embarrassment of having to explain why he had suddenly aquired a Mac for a jock-strap, Peter fled to a small cave in the mountains. From there, he spent the next six years of his life transmitting moronic posts to the people of Jaguar-ville through the internet. Using the alias "Sinclap", he attacked the Atari products which had made his precious Apple look foolish.

Recently, a recession had struck the world. Atari Corporation had falled on hard times, but was able to survive through careful financial control. Peter rejoiced when it looked like Atari would be no more! But then, disaster struck.

Atari introduced a revolutionary new game system called the Jaguar. A technical wonder, it captured much attention from the world. Third party developers signed on to produce games and exciting peripherals. Peter was agast! He could not let Atari ruin his revenge by staying alive. He decided to resort to a last ditch effort. Laughing diabolically, he plotted to steal every Jaguar that was under the Christmas trees in Jaguar-ville.

He set about designing a crude Santa costume and built a crude sleigh to help him carry away all the Jaguars that lay wrapped under the trees. That night, the dastardly fiend descended down the mountain to carry out his horrid task.

Unfortunately, the first house he broke into, was also the last. The family was up playing a late-night game of "Aliens Vs. Predator" and when they saw the mutated thing sporting a Macintosh prophylactic, they freaked. The grand-mother leaped to her feet and dealt Peter a crushing left hook to the jaw. He fell to the ground unconcious.

When he awoke, he found himself tied to a slab in the centre of Jaguar-ville. An angry mob was busy bombarding Peter with various press reports of the Jaguar's success. Peter screamed in agony and struggled to escape, but it was no use. The evening climaxed when the real Santa flew overhead and bombarded Peter with thousands of Apple products that he had been unable to give away. Off in the distance, Travis remarked "Yes Virginia, there is a Santa Claus!"

With the wicked forces of Sinclap destroyed, the citizens of Jaguar-ville cheered loudly and participated in a mass competition of "Doom". Robert Jung said "and God bless us, everyone!"

Merry Christmas, everyone!

No, I'm not.
What makes you think that the Amiga operating system's method of
multitasking is the ONE, TRUE means by which TRUE, REAL multitasking
can be achieved?

|> co-operative can be bad if not done right.

Hmmm... really? Well, I know you can make applications that
"will not really cooperate" in multitasking, but if cooperative
is so good, then why has Apple stated they are moving their OS
to preemptive multitasking in the future, eh?

[stuff deleted]

|>
|> No need for quotes; co-operative multitasking is true multitasking,

Oh, yeah, right.

|> just not your favorite method. You seem to have a problem with the
|> reality of things you do not like. It is not the Macintosh computer,
|> but the Macintrash graphing calculator. Not co-operative multitasking,
|> but co-operative 'multitasking' (trans. wants to be but is not). This

Just to let you know, in cooperative the programmer has to be
pretty damn aware that the OS needs control. THIS IS NOT NICE
when you are entering a complex function that will require time
and such.

Why would the programmer has to worry with things like that? Sounds
like a step backwards in the "multitasking evolution" to me...
To quote approximately Byte magazine about the Mac OS

"The Mac OS in contrast [comparing to the Amiga OS], has a very
tight loop that has to be called as often as possible. The quality
of an OS goes down with the 'more' as often as possible things that
exist, that need to be called" - Byte 1985(6?) (don't remember the
date)- comparison of AmigaOS and MacOS.

Is that why all Sinclap's usenet posts are such crap? I mean, the quality
of the materials that came out of "that area" must of been of the lowest
quality known to man or beast!

...

> Merry Christmas, everyone!

> >> Mark <<

I got a good laugh out of this post. This is the funniest thing I have seen
here since the Lord Comatos Era! Just one question. What did they do to
Sinclap after Christmas? Did they throw him into a bon fire of burning Apple
press statements (which would be painful for him)? Or did they put him in a
prison in which he was totally isolated from Apple and his favorite machine,
the Mac (which would be even more painful)?

No one is claiming that cooperative multitasking is perfect. But given a choice between fast processor, notebook computing, fast graphics, good applications and cooperative multitasking and slow processors, sorry applications, no notebook computer and preemptive multitasking I'll take the former any day.

Well a more recent article said that Amiga hardware had been allowed to languish and the software support was practically non-existance.

Note, however, that the paraphrased quote makes no mention of "true multitasking" or any such nonsense.

I live in Grinnell, Iowa - the home of Grinnell College in the hart of Powesheik County.. There is half a dozen Wally Worlds in a 30 mile radius..None of them carry the jagflops but plenty of Nintendos and Segas. What makes you think the Jagflops are selling well using one area. Atari through their numerous press statements is that 200,000 Jagflops will be maufactured in all of 1994. Hardly a success..

Just pick up the Dec copy of BYTE magazine. It does say that teh MacOS is
behind time and does not do preemptive multitasking.

No need to go so far back, just see Byte (Dec 94). It says that the latest
MacOS is not "true multitasking".

And what happens when you have to format a floppy? What happens
when you have to do a pull-down on a graphic menu to select fonts
and you, let's say, have the menu down for about 5 seconds deciding
which font to use?

If I remember correctly, the Mac completely halts. Also what's
the maximum modem speed your program supports while you are downloading
in the background?

Can you also use your StyleWriter (print) while you continue downloading?

Last I heard was that things like this made high-speed modem
Mac communicatinos (14.4k +, let alone the new 28.xxxk) very unreliable.

I too am a student, its just that in recent years most people I have
spoken too pirate rather than buy software, you are right however
it's not just students. I mearly mentioned this as it is an added
incentive for students to buy the software, an advantage which the
rest do not have. To be honest I'd say that a large part of the Atari
user base is students, who for various reasons (probably cash) do not
or cannot move on to another platform.

: and brains, a management team led by the Skullman himeself, John Sculley...
: But Atari is too stupid anyways, because anyone with brains might upstage the
: Tramiels..

I'd agree with this. Perhaps not Irving Gould though. Certainly Atari
does need a new team at its helm. Poeple who have the vision to develop
new products and that includes personal computers. People who basically
have a clue. All is not lost for Atari in the computers games yet, most
people know the brand name, most people knew someone who at one time
had an ST. However no-one has heard of the Falcon, who is to blame for this?
Atari me thinks. The Falcon would have sold in good numbers if:
1) they had marketed it.
2) They stuck with it ie people knew that 2 years down the
track a new 'faster & better' machine could be had.
3) They had sold it on the high street with a decent bundle
of software.

If Atari had done the above then perhaps it would now still have a decent
market share and established user base. Just look at Apple in the UK,

until about 2 years ago Apple suff was RARELY seen in the high street
then over the Chritmas period they saturated high street stores. Now you
can buy Apple hardware & software on any high street.

Raist, also mention that the Amiga can format a floppy and play an Atari 2600 style game at the same time...Such progress. No Stupid! It's the Apps.

Whose stupid? And what about the Apps? The MacOS does not multi-task
as well as the AMIGA's can. If apps were written well it would be better
tha it is now. But apps aren't written well, in that respect.

The MacOS and it's current Apps do not allow you to say download a
something or other at 14.4, play a mod, and render something in KAI's
powertools. IN fact no one can do anything else while rendering in KAI's
since that program stops rendering when you hit a mouse button. That
is so dumb. Well you can do something, you can watch the thing render
for an hour.

There are major flaws in the way that the MAC multi-tasks, it does multi-task
it just doesn't switch between apps intelligently or frequently enough.

Sure. Art is real stupid. Art is also one of those niches that secured the
Macintosh in the first place.

>Real systems? Here is a description of your "real" system:
>
>1) "Real systems" are loser-friendly. People who have been denied UNIX
>accounts, or those who could not find a way to edit their CONFIG.SYS
>and AUTOEXEC.BAT files can use "real systems."

Or people who would not need or Want UNIX accounts. For all I use mine
(mailserver), I could just as well leave my Mac on 24hours a day.

>2) "Real systems" are idiot-proof: they warn the user before every action.
>"Are you sure you want to empty thrash?" For all the system knows,
>people like Mike Cohen may be attempting to delete their hard-drives.

Moron. Nothing is idiot-proof. Just when you think something is,
along comes another idiot who doesn't know how to turn of balloon
help or check the little box in the Get Info for Trash DBox that
removes the annoying warning.
>
>3) "Real systems" pester the user with unnecessary details; they show

>makes chips in the spare time when they do not make car phones.
>Or some mediocre RISC chip which the users find
>a novelty, since they think that the 'DEC Alpha' is a rock band.

Oh, yes. Definitely the worst. Which is why SGI, Sun, and HP
used to manufacture UNIX boxes in the 80s around the 68k line, instead
of the 286 or 8088. What UNIX was available for the 286? Minnix?
Also, were you aware that the 68k line of processors is the core
of the Amiga itself? I think that alone indicates the processor
line's superiority over the 8x86 legacy.

As for the PPC being mediocre, I have only to say that it's cheap,
a lot less buggy than the 586, and offers better price/performance.
The 620 shrieks as well. We'll see, tho. In lots of 10,000,
how much are DEC Alphas?
>
>5) "Real systems" communicate via a graphical user interface.
>They rely only on the mouse, because the programmer forgot that
>there actually existed a keyboard. (Some people argue that they
>*knew* that a keyboard was going to be shipped with the computer,
>but they figured the users would not be smart enough to use it.)
>
Almost every computer manufactured nowadays comes with a damn mouse.
SGIs, HPs, Suns, Dells, Compaqs, Amigas and Macintoshes. I'd very much
like to know where you get your arguments, and how much you pay for
them. Whatever it is you're paying, it's obviously too much or
not enough.

>6) "Real systems" run on computers named after fruits.

A nonissue. Who cares what the hell they are named after?
>
>7) "Real systems" report every single detail of what is going on.
>Preparing to copy. Copying 1 of 10. Copying 2 of 10, etc.
>This is mainly because it would be very surprising,
>if the operation actually carried through to completion without
>an error. So the programmers apparently wanted to foster their ego
>by having the computer boast about being able to copy files.

I think this is somewhat of a pathetic gripe. It's like compaining
that computers come in plastic cases.

>Caveat: Powerful operating systems do not need to tell the user
>what has been going on. Unix is quiet and reserved, only speaks

>when necessary."She" knows what "she" is doing.
>MS-DOS is a talkative teen-ager who can never shut-up. System 7.x
>is an annoying chatterbox suffering from menapause.

Emptor: Powerful operating systems do what they need to do. Part
of the selection process of a computer is the OS. The Mac OS
is still powerful (certainly moreso than Windows or DOS. We'll
see about Chicago).

>
>8) "Real systems" feature 100 hundred different versions of poor
>rip-offs of UNIX network commands such as telnet, ftp and rn.
>Since there is no CLI, there is no direct access to the networking
>capabilities of UNIX and 100 blithering idiots try their hands
>in writing e-mail or newsreading programs to interface with the
>"system" How they fail is the story of Macintrash networking.

Go back to your little VAX terminal and cry then. I'm certain
you shall find the support you seek there. I don't give a
rat's ass about whether or not I can telnet or ftp from my
Mac (and I can--I simply chose not to). As for the story of
Macintosh networking (I really hate to correct spelling mistakes,
so please learn to spell what you obviously desise so much... it's
Macintosh. Big M, little a, little c, little i, little n, little
t, little o, little s, little h, period), I suggest you reconsider:
it's free with every system. Startup and go. What other end is
needed here?

>Caveat: UNIX is everywhere; when you are sending mail on the
>Macintrash, your program connects to the server at port 25,
>sends a HELO command, sends MAIL FROM and RCPT headers,
>then the subject line and the body of the text, and QUITs.
>Although the Macintrash user is not smart enough to figure out what
>is going on, the program is. This is one of the few situations
>where a program is more intelligent than the "system" user.
>

How intriguing, then, that I use a PPP connection over a 14.4 modem, and
it never skips a beat, no matter how much junk I'm running or how long I
pull a menu down.

Hint: time critical programs can hook into things like the vertical blank
interrupt, rather than using the normal cooperative method of getting CPU
time.

5090. DECEMBER Jaguar Letter Writing Campaign

Newsgroup: comp.sys.atari.advocacy
Date: 1994-12-07 03:29:30 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <3c3a6q$rau@usenet.INS.CWRU.Edu>
Source record: 14289
Cross-posted to: rec.games.video.atari,rec.games.video.misc,comp.sys.atari.advocacy,alt.games.lynx

Ok folks, this is the last month of the letter writing campaign to software companies to get them to make games for the Jaguar. I'll take requests for other companies not mentioned for future campaigns.

The fact is that PSX, U-64, and Saturn are coming next year and Sony, Nintendo, and Sega are already attempting to convince companies to make games for their system intead of Jaguar. If this happens, kiss the $250 you spent on the Jaguar goodbye!

Hell, you can also kiss that $100+ spent on Jaguar games goodbye while your at it.

I estimate that in order for Jaguar to survive, it will need 3x more games than PSX, U-64, and Saturn have by Fall of 1995. Since the major companies have NOT signed up yet to develop for the Jaguar, this doesn't look like it will happen right now.

It is a race against time right now for Jaguar and you can help this system to get going a little faster by writing software companies. You have to convince these companies to develop for the Jaguar before they are already committed to other systems.

The following is the DECEMBER part of the 1994 JAGUAR LETTER WRITING CAMPAIGN. I will post a complete listing after this list for anyone wishing to write companies from previous months.

Len Stys

December 1994 CAIN Jaguar Letter Writing Campaign

Organized by: Len Stys

The following is part of the 1994 CAIN Jaguar Letter Writing Campaign. Only the month of December is listed. If you wish to still send letters for September, please read the CAIN Newsletter Supplement for the complete campaign.

The goal of this campaign is to interest popular game companies to make their games for the Jaguar.

****
********** DECEMBER, 1994 **********
****

QQP, Inc.
Broderbund
Konami

MicroProse

>>>>>>>>>>>>>>>>>>>>>>>>>>>> QQP, Inc <<<<<<<<<<<<<<<<<<<<<<<<<<<<

Many people are not familiar with QQP, but the company has released some pretty amazing games for the PC. Some of the games are: Solitaire's Journey, Merchant Prince, The Perfect General, Conquered Kingdoms, and their most recent--Origamo.

Most of the games that QQP makes either has to do with strategy or war. Strategy games are always popular, but war games have been restricted to PCs due to lack of a "save game" feature on video game systems. Jaguar can save games on its cartridges so this is no longer a problem in getting war games to home video game systems.

The mailing address for QQP, Inc. is:

QQP, Inc.
495 Highway 202
Flemington, NJ 08822

The following is a list of things in which you may want to say in your letter to QQP:

Dear Sir or Madam,

1) How much you enjoy strategy games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you love to see on the Jaguar (choose two or three QQP games).
5) How you would like to see these games make use of Jaguar's voice-modem and networking capabilities.
6) How you believe QQP games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy QQP games when they are produced for the Jaguar.
8) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>> Broderbund Software Inc. <<<<<<<<<<<<<<<<<<<<

Broderbund Software is well-known for producing two games. The first game is a CD-ROM game called Myst. The second is the Carmen Sandiego series of games. The Carmen Sandiego is educational.

The mailing address for Broderbund Software Inc. is:

Edmund R. Auer, President
Broderbund Software Inc.
500 Redwood Blvd.

Novato, CA 94948-6121

The following is a list of things in which you may want to say in your letter to Broderbund:

Dear Mr. Auer,

1) How much you enjoy Broderbund Software's games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) How you would love to see Myst, Carmen Sandiego, and any other new Broderbund titles on the Jaguar.
5) How unbelievable Broderbund Software games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Broderbund Software's games when they are produced for the Jaguar.
7) A thank you to Mr. Auer for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>>>>> Konami Inc. <<<<<<<<<<<<<<<<<<<<<<<<<<<

Konami makes several popular games. Among these are Double Dribble: The Playoff Edition, Lethal Enforcers 2, Batman the Animated Series, and a new game called Contra 4. The company has also made Rocket Knight Adventures, Teenage Mutant Ninja Turtles Tournament Fighters, Blades of Steel, Track & Field II, Top Gun: The Second Mission, and many others. Konami is also rumored to be developing Gradius for Sony's new PSX. Since Konami is already developing for other next generation systems, it may be more difficult to convince them to make games for the Jaguar. But Konami certainly does bring a lot of titles to a game system.

The mailing address of Konami is:

Konami Inc.
900 Deerfield Parkway
Buffalo Grove, IL 60089-4510

The folowing is a list of things in which you may want to say in your letter to Konami:

Dear Sir or Madam,

1) How much you enjoy Konami games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a few Konami games).
5) How unbelievable Konami games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Konami games when they are produced for

the Jaguar.
7) A thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>> MicroProse Inc. <<<<<<<<<<<<<<<<<<<<<<<<

MicroProse is already developing Jaguar games so this letter will be mainly to thank MicroProse and encourage the company to make more of their games for the Jaguar. MicroProse is supposedly making Grand Prix, Gunship 2000, and possibly Star Trek: The Next Generation game. But MicroProse has made a lot of fantastic games for the PC that should really be made for the Jaguar. These include: World Circuit, Fleet Defender, Master of Orion, and Civilization. Civilization has already been made for the Falcon030 so it may not be too hard to convert the game to the Jaguar. Since Jaguar can save games on cartridge, it may be possible to make Civilization on the Jaguar. MicroProse is also making Across the Rhine, Colonization, and Masters of Magic.

MicroProse is indeed a very good company to have making Jaguar games. The quality has always been good and it would be nice for the company to make a lot of their games for the Jaguar.

The mailing address for MicroProse is:

Ronald J. Bueche, CEO
MicroProse Inc.
180 Lakefront Dr.
Hunt Valley, MD 21030-2245

The following is a list of things in which you may want to say in your letter to MicroProse:

Dear Mr. Bueche,

1) How much you enjoy MicroProse games.
2) How much you enjoy your Atari Jaguar.
3) How you are really glad that MicroProse is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games besides Gunship 2000 and Grand Prix be made for the Jaguar (name a few of your favorite MicroProse games).
6) How you would like to see the Jaguar voice modem and network capabilities used in MicroProse games. (OPTIONAL)
7) How you will run out and buy MicroProse games when they are produced for the Jaguar.
8) Thank you to Mr. Bueche for reading your letter and for making games for the Jaguar.

You may also want to FAX MicroProse at the phone number: 410/771-1174. But only FAX MicroProse if you do not have time to mail the letter or if

you have already sent mail to the company.

********* THANK YOU! *********

Please spread the word about this December campaign to your friends and encourage everyone to participate!

--

5091. 1994 Jaguar Letter Writing Campaign (complete!)

Newsgroup: comp.sys.atari.advocacy
Date: 1994-12-07 05:16:52 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <3c3gg5$91e@usenet.INS.CWRU.Edu>
Source record: 14290
Cross-posted to: rec.games.video.atari,rec.games.video.misc,alt.games.lynx,comp.sys.atari.advocacy

Hi folks,

I spent about 10 hours getting the names, addresses, and information related to these well-known game software companies for you. I did this back in September because I felt it was real important for everyone to write these companies and let them know we want their games for the Jaguar.

If you haven't written them because you didn't have time, this is your last chance this year to write them.

It is extremely important for these companies to start developing on the Jaguar now. In fact, December is really the last month that developers can start developing for the Jaguar and have their game out for it by Christmas of next year. This is because it takes approximately 9 months to develop and manufacture a Jaguar game. And add another couple of months if the programmers need to get familiar with the unit.

If you are worried that Sony, Nintendo, and Sega are going to come along late next year with a $70 million advertising budget to spoil the Jaguar's fun--you should be worried! Because that is what the companies are planning to do.

Right now, Sony, Nintendo, and Sega are attempting to convince these very companies listed in this text-file to develop for their next generation system. Atari Corp. is probably doing the same thing. But Sony, Nintendo, and Sega are bigger players than Atari right now. This is why we need to help Atari out a little bit by letting these companies know that we want their games for the Jaguar.

I cannot urge you enough to write these companies. You (even though you may not realize it) play a big part in if the Jaguar succeeds or fails. Just by -one- letter to each of these companies could determine Jaguar's fate and your investment in purchasing the Jaguar and several of the games for the Jaguar.

Christmas time is about GIVING to others. Why not give Jaguar a chance in 1995? Write these companies.

END OF THE YEAR Jaguar Letter Writing Campaign

Organized by: Len Stys

E-mail: aa399@cleveland.freenet.edu

id Software
WMS Industries Inc.
Capcom USA Inc.

Electronic Arts Inc.

>>>>>>>>>>>>>>>>>>>>>>>>> id Software <<<<<<<<<<<<<<<<<<<<<<<<<

The letter to id Software should thank the company for producing
Wolfenstein 3-D and DOOM for the Jaguar and encourage the company to make
QUAKE for the Jaguar.

id Software's e-mailing address:

Jay Wilbur, CEO
id Software
Town East Tower
18601 LBJ Freeway
Suite 615
Mesquite, Texas 75150

The following is a list of things which you may want to say in your
letter to id Software:

Dear Mr. Wilbur,

1) How much you enjoy Jaguar Wolfenstein 3-D and/or DOOM.
2) How much you like id Software.
3) Thanks for making Wolfenstein 3-D and DOOM for the Jaguar.
4) How you are excited about id Software making games for the Jaguar.
5) How you would like to see QUAKE made for the Jaguar.
6) Thank you to Mr. Wilbur for reading your letter.

Another thing which you may want to include in this letter is concerning
the Jaguar resolutions. It is possible for id Software to release
DOOM II for Jaguar next year. If you would like to see DOOM II for the
Jaguar, encourage the company to make it. But if you do encourage them
to make it, ask that it support modem and at least four players networked.
Also, ask for the company to place DOOM II on cartridge so that public
domain maps can be released on CD for Jaguar's CD-ROM player. This will
make sure that DOOM II -never- gets boring on the Jaguar and multi-playing
is always exciting.

>>>>>>>>>>>>>>>>>>>>>> WMS Industries Inc. <<<<<<<<<<<<<<<<<<<<<<

As of December 1, 1994, Mortal Kombat II has not been announced for the
Jaguar. And Acclaim has no plans to produce Mortal Kombat for the Jaguar.
But next year, WMS Industries will be able to release Mortal Kombat II for
any game system that the company wishes to release it for. The time is
now to let WMS Industries know that we want to see Mortal Kombat II and
Mortal Kombat III for the Jaguar.

Mortal Kombat II is by far the #1 most wanted game for the Jaguar
according to the Most Wanted Games for the Jaguar list by CAIN Newsletter.
If this game is released for the Jaguar, the Jaguar will be the most
wanted game system.

The mailing address of WMS Industries Inc. is:

Louis J. Nicastro, CEO
WMS Industries Inc.
3401 North California Ave.
Chicago, IL 60618-5889

OK. I don't think I have to remind you that you should write as neat and as professional as possible to get the best results. If you certify your letter, you may even reach the president with your letter.

The following is a list of things in which you may want to say in your letter to WMS Industries Inc.:

Dear Mr. Nicastro,

1) How much you enjoy Mortal Kombat II
2) How you like the games that WMS Industries makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get the game for the Jaguar as soon as it is released.
6) How you would also like to see Jaguar be the first system to get Mortal Kombat III.
7) Thank you to Mr. Nicastro for reading your letter and for considering making Moral Kombat II for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>> Capcom USA INC. <<<<<<<<<<<<<<<<<<<<<<<

Capcom is known for producing the Street Fighter II series of games. The company is also known for producing games such as The Great Circus Mystery Starring Mickey & Minnie Mouse, Demon's Crest, and Saturday Night Slam Masters. The company also does conversions of popular titles such as Wizardry V and Eye of the Beholder.

Super Street Fighter II Turbo is second only to Mortal Kombat II on the most wanted games for the Jaguar CAIN Newsletter listing. If the game existed for the Jaguar, it would no doubt sell a lot of Jaguars. But Capcom is not making Super Street Fighter for the Jaguar and no plans have been announced to do so in the near future.

The strange thing is that Capcom is making Super Street Fighter II Turbo for the 3DO platform. The game will even have better graphics than that on the SNES and Genesis. But this only means that if Capcom will make a version of SSFIIT for a much higher-priced system than there is a chance that the company will be willing to make a Jaguar version.

The mailing address for Capcom USA Inc. is:

Scott Smith
Product-Development Coordinator
Capcom USA Inc.
475 Oakmead Parkway

Sunnyvale, CA 94086

The following is a list of things in which you may want to say in your letter to Capcom USA Inc.:

Mr. Smith,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get Super Street Fighter II Turbo for the Jaguar as soon as it is released.
6) Thank you to Mr. Smith for reading your letter and for considering making Super Street Fighter II Turbo for the Jaguar.

You may also want to FAX Capcom USA by the phone number: 408/774-3995. But sending mail through the U.S. Postal Service may prove to be more successful.

>>>>>>>>>>>>>>>>>>>> Electronic Arts Inc. <<<<<<<<<<<<<<<<<<<<

Electronic Arts is the publisher of some incredible games such as: NBA Showdown, FIFA International Soccer, PGA European Tour Golf, NHL Hockey '94, Wing Commander, Super Wing Commander, John Madden NFL Football, Escape from Monster Manner, Twisted, Mario Andretti Racing, MLBPA Baseball, and many more! Electronic Arts also owns several other software companies that they may give the OK to develop the Jaguar for if they see there is a demand for Jaguar games.

Unfortunately, Electronic Arts is also a major backer of 3DO, a company that is a big competitor of Atari Corp. Electronic Arts is spending a lot of time and money on making games for 3DO that it could be spending on the Jaguar.

There is hope though! Electronic Arts is a licensee. This means that the company has Jaguar developers units. Electronic Arts' management just has to give the OK to make games for the Jaguar.

The mailing address for Electronic Arts Inc. is:

Lawrence F. Probst III, President
Electronic Arts Inc.
1450 Fashion Isle. Blv.
San Mateo, CA 94404

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Probst,

1) How much you enjoy Electronic Arts games.
2) How you have been buying Electronic Arts games for your computers since the company was started (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) The games that you would love to slee on the Jaguar (choose two or three Electronic Arts games--I'm choosing John Madden NFL Football!).
6) How you believe Electronic Arts games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Electronic Arts' games when they are produced for the Jaguar.
8) Thank you to Mr. Probst for reading your letter and a thank you for considering producing games for the Jaguar.

Sierra On-Line Inc.
Dynamix Inc.
LucasArts Entertainment Co.
NovaLogic

>>>>>>>>>>>>>>>>>>>>>>>> Sierra On-Line Inc. <<<<<<<<<<<<<<<<<<<<<<<<

Sierra On-Line is a company that is well-known for their role-playing games such as their Space Quest and Police Quest series. The company is also known for their latest hits in the PC world: Gabriel Knight, Aces Over Europe, and Leisure Suit Larry VI. Sierra On-Line is planning to release their new title, Phantasmagoria, very soon.

Sierra On-Line is definitely a company that needs to be developing for the Jaguar if the Jaguar CD-ROM is to become used. If Sierra On-Line starts making games for the Jaguar CD-ROM, several other companies will make games for it as well.

The mailing address for Sierra On-Line is:

Kenneth A. Williams, President
Sierra On-Line Inc.
P.O. Box 485
Coarsegold, CA 93614

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Williams,

1) How much you enjoy Sierra On-Line games.
2) How you have been buying Sierra On-Line games for your computer since the company started making computer games (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see Sierra On-Line producing several Jaguar CD-ROM games.

6) The games you would love to see on the Jaguar (choose two or three Sierra On-Line games).
7) How you believe Sierra On-Line games would be fantastic on the Atari Jaguar.
8) How you will run out and buy Sierra On-Line games when they are made for the Jaguar.
9) Thank you to Mr. Williams for reading your letter and for considering producing games for the Jaguar.

In my letter, I will also be encouraging Mr. Williams to make games which have the option of using a keyboard with the Jaguar. A keyboard can be created for the Jaguar and Sierra On-Line could work with Atari Corp. to produce one for it. The use of a keyboard in role-playing games help children learn words. This is something that Sierra has gotten away from in PC games.

I'm also writing Sierra to release HOYLE Card Games for the Jaguar. I love this game and it would be great to see a modem feature being used in the Jaguar version of this game.

>>>>>>>>>>>>>>>>>>>>>>>>> Dynamix Inc. <<<<<<<<<<<<<<<<<<<<<<<<<

Dynamix Inc. is a game company owned by Sierra On-Line. This game company makes many wonderful titles for the PC such as: Betrayal at Kronder, Aces of the Pacific, and Front Page Sports Football Pro. The company is planning to release: Front Page Baseball, Battledrome, LodeRunner: A Legend, MetalTech: Earth Siege, Alien Legacy, and an excellent reviewed game called Aces of the Deep (submarine game).

Dynamix Inc. is making some real great games and these games would be a very good addition to the present Jaguar game library.

The mailing address for Dynamix Inc. is:

Alan Higginson
Executive Vice-President
Dynamix Inc.
P.O. Box 978
Oakhurst, CA 93644-0978

The following is a list of things in which you may want to say in your letter to Dynamix Inc.:

Dear Mr. Higginson,

1) How you enjoy Dynamix games on the PC.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or three Dynamix games--I'm choosing Front Page Sports Football, Alien Legacy, and Aces of the Deep).

5) How you believe Dynamix games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Dynamix games when they are produced for the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>> LucasArts Entertainment Co. <<<<<<<<<<<<<<<<<<

LucasArts is famous for making games based on popular movies. The company has also has several popular titles out for the PC. Some of these titles are: Star Wars Rebel Assault, X-Wing, Indiana Jones and the Fate of Atlantis, Monkey Island 2: Le chuck's Revenge, and Day of the Tentacle. And if there is any truth to the rumor of a new Indiana Jones movie, LucasArts will probably make a great game based on this movie.

The mailing address for LucasArts is:

LucasArts Entertainment Co.
LucasArts Games Division
P.O. Box 10307
San Rafael, CA 94912

The following is a list of things in which you may want to say in your letter to LucasArts:

Dear Sir or Madam,

1) How much you enjoy LucasArts games.
2) How much you enjoy the Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games you would love to see on the Jaguar (choose two or three LucasArts games).
5) How you believe LucasArts games would be fantastic on the Atari Jaguar.
6) How you will run out and buy LucasArts games when they are made for the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX LucasArts by the phone number: 415/721-3344.

>>>>>>>>>>>>>>>>>>>>>>>>>>>> NovaLogic <<<<<<<<<<<<<<<<<<<<<<<<<<<<

NovaLogic is known for its high-quality games on the PC. The president and CEO, John Garcia makes sure each game title released is of the highest quality. NovaLogic is known for producing Comanche: Maximum Overkill (a game title that rated high on the Most Wanted Games for the Jaguar listing from CANI Newsletter). The company also produced WolfPack (a submarine simulator) and UltraBots. The latest and greatest game from

NovaLogic is Armored Fist. This game is highly praised by reviewers that have seen it.

John Garcia is interested in producing modem games and networking games in the future. NovaLogic's games would be a great addition to the Jaguar game library.

The mailing address for NovaLogic is:

John Garcia, President
NovaLogic
19510 Ventura Blvd.
Suite 200
Tarzana, CA 91356

The following is a list of things in which you may want to say in your letter to NovaLogic:

Dear Mr. Garcia,

1) How much you enjoy NovaLogic games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple of NovaLogic games).
5) How you believe that NovaLogic games will be even more fantastic when using the graphics and sound capabilities of the Jaguar.
6) How you would like to see NovaLogic games that use the Jaguar voice-modem and networking capabilities.
7) How you will run out and buy NovaLogic games when they are produced for the Jaguar.
8) Thank Mr. Garcia for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX NovaLogic by the phone number: 818/774-0684. Please consider writing NovaLogic through the U.S. mail first and then FAX NovaLogic.

Virgin Games
Spectrum Holobyte
Psygnosis
Origin Systems

>>>>>>>>>>>>>>>>>>>>>>>>>> Virgin Games <<<<<<<<<<<<<<<<<<<<<<<<<<

Virgin Games is already a Jaguar developer, so this letter is mainly to thank the company and to encourage them to make more titles for the Jaguar. Virgin is suppose to be making Cannon Fodder, Demolition Man, and Dragon for the Jaguar. The company is also planning to make a CD-ROM game called Creature Shock for the Jaguar.

Virgin Games is known for making a popular PC CD-ROM game called:
The 7th Guest. It has also made Land of Lore, Dune II, and
Indy Car Racing. It will also be releasing 11th Hour and Command & Conquer
for the PC soon.

The mailing address for Virgin Games is:

Virgin Games
18061 Fitch Avenue
Irvine, CA 92714

The following is a list of things in which you may want to say in your
letter to Virgin Games:

Dear Sir or Madam,

1) How you enjoy Virgin Games' games.
2) How much you enjoy the Atari Jaguar.
3) How you are really happy that Virgin Games is making games for the
Jaguar.
4) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
5) How you would like to see other popular games such as The 7th Guest
(and name a few) besides the ones the company is already making
for the Jaguar.
6) How you would like to see the Jaguar modem and network features used
in Virgin Games' software (OPTIONAL).
7) How you will run out and buy Virgin Games' games when they are
produced for the Jaguar.
8) Thank you to the person for reading your letter and for producing
games for the Jaguar.

You may also want to FAX Virgin Games by the phone number: 714/833-8717.

>>>>>>>>>>>>>>>>>>>>>>> Spectrum Holobyte <<<<<<<<<<<<<<<<<<<<<<<

Spectrum Holobyte is famous for their Falcon flight simulator game.
The game can even be played through the modem on PCs. Spectrum Holobyte
has just released Fields of Glory and is rumored to be working on
Falcon 4.0.

Modem games is something that a game system must have if it will be
successful in the future. And Spectrum Holobyte is well-known for their
modem games. Falcon 4.0 sounds like it would be perfect for the
Jaguar.

The mailing address for Spectrum Holobyte is:

Barry J. Folsom, President
Spectrum Holobyte
2490 Mariners Square Loop
Alameda, CA 94501

The following is a list of things in which you may want to say in your letter to Spectrum Holobyte:

Dear Mr. Folsom,

1) How much you enjoy Spectrum Holobyte games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) How you would like to see Falcon 4.0 with voice-modem and networking capabilities on the Jaguar.
5) How you would like to see Fields of Glory and other Spectrum Holobyte games for the Jaguar.
6) How you believe Spectrum Holobyte games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Spectrum Holobyte games when they are produced for the Jaguar.
8) Thank Mr. Folsom for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX Spectrum Holobyte by the phone number: 510/522-2138. But please keep in mind that sending a letter through the U.S. Postal Service may be more effective.

>>>>>>>>>>>>>>>>>>>>>>>>> Psygnosis <<<<<<<<<<<<<<<<<<<<<<<<<

Psygnosis is a well known producer of video games. A few of Psygnosis' popular games are Microcosm, Shadow of the Best II, and Puggsy. A recent game is Hexx: Heresy of the Wizard. TThe company has also done Lemmings.

The mailing address for Psygnosis is:

Psygnosis
675 Massachusetts Ave.
Cambridge, MA 02139

The following is a list of things in which you may want to say in your letter to Psygnosis:

Dear Sir or Madam,

1) How much you enjoy Psygnosis games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple of Pysgnosis games).
5) How you believe Psygnosis games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Psygnosis games when they are produced for the Jaguar.
7) Thank the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX Psygnosis by the phone number: 617/497-6759.

>>>>>>>>>>>>>>>>>>>>>>>>> Origin Systems <<<<<<<<<<<<<<<<<<<<<<<<<

Origin Systems is a maker of many popular PC role-playing and action games. The company is owned by Electronic Arts but may have freedom to develop for any system it wishes. Some of the games that Origin makes are: Ultima series (most recently Ultima VIII: Pagan), Wing Commander Privateer, and just recently Pacific Strike. Origin will be also making Biforge and Wings of Glory.

Since Origin Systems is a subsidary of Electronic Arts, there is no specific person to write.

The mailing address for Origin Systems is:

Origin Systems
Attn: Production Teams
P.O. Box 161750
Austin, TX 78716

The following is a list of things in which you may want to say in your letter to Origin Systems:

Dear Sir or Madam,

1) How much you enjoy Origin Systems games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or three Origin Systems games).
5) How you wish the Origin Systems Production Teams will attempt to get these great games on the Jaguar.
6) How unbelievable Origin Systems games will be when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Origin Systems games when they are produced for the Jaguar.
8) A thank you to the person reading for reading your letter and for considering producing games for the Jaguar.

QQP, Inc.
Broderbund
Konami
MicroProse

>>>>>>>>>>>>>>>>>>>>>>>>>>>> QQP, Inc <<<<<<<<<<<<<<<<<<<<<<<<<<<<

Many people are not familiar with QQP, but the company has released some pretty amazing games for the PC. Some of the games are: Solitaire's Journey, Merchant Prince, The Perfect General, Conquered Kingdoms, and their most recent--Origamo.

Most of the games that QQP makes either has to do with strategy or war. Strategy games are always popular, but war games have been restricted to PCs due to lack of a "save game" feature on video game systems. Jaguar can save games on its cartridges so this is no longer a problem in getting war games to home video game systems.

The mailing address for QQP, Inc. is:

QQP, Inc.
495 Highway 202
Flemington, NJ 08822

The following is a list of things in which you may want to say in your letter to QQP:

Dear Sir or Madam,

1) How much you enjoy strategy games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you love to see on the Jaguar (choose two or three QQP games).
5) How you would like to see these games make use of Jaguar's voice-modem and networking capabilities.
6) How you believe QQP games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy QQP games when they are produced for the Jaguar.
8) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>> Broderbund Software Inc. <<<<<<<<<<<<<<<<<<<<

Broderbund Software is well-known for producing two games. The first game is a CD-ROM game called Myst. The second is the Carmen Sandiego series of games. The Carmen Sandiego is educational.

The mailing address for Broderbund Software Inc. is:

Edmund R. Auer, President
Broderbund Software Inc.
500 Redwood Blvd.
Novato, CA 94948-6121

The following is a list of things in which you may want to say in your letter to Broderbund:

Dear Mr. Auer,

1) How much you enjoy Broderbund Software's games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.

4) How you would love to see Myst, Carmen Sandiego, and any other new Broderbund titles on the Jaguar.
5) How unbelievable Broderbund Software games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Broderbund Software's games when they are produced for the Jaguar.
7) A thank you to Mr. Auer for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>>>>> Konami Inc. <<<<<<<<<<<<<<<<<<<<<<<<<<<

Konami makes several popular games. Among these are Double Dribble: The Playoff Edition, Lethal Enforcers 2, Batman the Animated Series, and a new game called Contra 4. The company has also made Rocket Knight Adventures, Teenage Mutant Ninja Turtles ournament Fighters, Blades of Steel, Track & Field II, Top Gun: The Second Mission, and many others. Konami is also rumored to be developing Gradius for Sony's new PSX. Since Konami is already developing for other next generation systems, it may be more difficult to convince them to make games for the Jaguar. But Konami certainly does bring a lot of titles to a game system.

The mailing address of Konami is:

Konami Inc.
900 Deerfield Parkway
Buffalo Grove, IL 60089-4510

The folowing is a list of things in which you may want to say in your letter to Konami:

Dear Sir or Madam,

1) How much you enjoy Konami games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a few Konami games).
5) How unbelievable Konami games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Konami games when they are produced for the Jaguar.
7) A thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>> MicroProse Inc. <<<<<<<<<<<<<<<<<<<<<<<<

MicroProse is already developing Jaguar games so this letter will be mainly to thank MicroProse and encourage the company to make more of their games for the Jaguar. MicroProse is supposedly making Grand Prix, Gunship 2000, and possibly Star Trek: The Next Generation game. But

MicroProse has made a lot of fantastic games for the PC that should really be made for the Jaguar. These include: World Circuit, Fleet Defender, Master of Orion, and Civilization. Civilization has already been made for the Falcon030 so it may not be too hard to convert the game to the Jaguar. Since Jaguar can save games on cartridge, it may be possible to make Civilization on the Jaguar. MicroProse is also making Across the Rhine, Colonization, and Masters of Magic.

MicroProse is indeed a very good company to have making Jaguar games. The quality has always been good and it would be nice for the company to make a lot of their games for the Jaguar.

The mailing address for MicroProse is:

Ronald J. Bueche, CEO
MicroProse Inc.
180 Lakefront Dr.
Hunt Valley, MD 21030-2245

The following is a list of things in which you may want to say in your letter to MicroProse:

Dear Mr. Bueche,

1) How much you enjoy MicroProse games.
2) How much you enjoy your Atari Jaguar.
3) How you are really glad that MicroProse is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games besides Gunship 2000 and Grand Prix be made for the Jaguar (name a few of your favorite MicroProse games).
6) How you would like to see the Jaguar voice modem and network capabilities used in MicroProse games. (OPTIONAL)
7) How you will run out and buy MicroProse games when they are produced for the Jaguar.
8) Thank you to Mr. Bueche for reading your letter and for making games for the Jaguar.

You may also want to FAX MicroProse at the phone number: 410/771-1174. But only FAX MicroProse if you do not have time to mail the letter or if you have already sent mail to the company.

****

********** LETTER WRITING CAMPAIGN FINISHED **********
* *
****

After you have done writing all of these companies, the letter writing campaign will be finished. If you have written all of these companies, the campaign will no doubt be successful and we will be seeing the games

we want for the Jaguar very soon.

Please spread the word around about this letter writing campaign on online systems, BBSs, message areas, user groups, and any other place that you can help get the word out abuot this campaign.

Also, please tell your friends! It is very important to get everyone participating in this letter writing campaign!

********** THANK YOU! **********

5093. Jag looks like a winner this Christmas

Newsgroup: comp.sys.atari.advocacy
Date: 1994-12-07 06:04:17 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <3c3j91$brm@usenet.INS.CWRU.Edu>
Source record: 14291

Jaguar sales have reportedly been doing a lot better ever since
Alien Vs. Predator has been released. Atari now has four block buster games
for the Jaguar: Alien Vs. Predator, Doom, Wolfenstein 3-D, and Tempest 2000.
And more blockbuster games are expected to be out this month such as
Iron Soldier and Kasumi Ninja.

Jaguar orders are increasing in the U.S. Japan is now carrying the Jaguar
which means Atari is beating Nintendo to the Japan market by at least several
months.

The Jaguar CD-ROM that was suppose to retail at $199.99 and something a lot
of people thought may cost $249.99 is now suppose to cost some place around
$149.99.

Byte mentioned that coorperative multitasking stuff that, they said that was
an add on and it's years behind preemtive multitasking. Hey, look at the good
side, they still "multitask" in a way :-)

Regards
William

|> By that definition, no single-processor machine multitasks because at
|> some point it's going to have to run code that can't be preempted.

Wrong definition. Check out the definition of multitasking
in an OS book. Multitasking can be task switching ("fast") in a
single processor or in a multiple processor configuration.

|> The bottom line is that the Mac multitasks. It may not do it the way
|> you like or as effectively as other operating systems, but it does.

I wouldn't call stoping all processes because I am making a menu
selection, or because I am formatting a hardisk, or becuase I am
spooling to the printing spooling process multitasking, but there
you go.

Seeing the list just made me remeber that in an interview in the Edge, LucasArts said they didn't believe in the jag, and scoffed at Atari...who knows, maybe a letter writing campaign can change their minds...

I won't say it is mega-robust. But about guys dialed on a bulleting
board, if the software is stable, it wouldn't crash. I know a friend
of mine who had a BBS on his A3000. OK, "hundreds" of users
is a bit too much :-)

|> they were playing a MOD and generating the graphics for the next Star
|> Wars movie (with NO SLOWDOWN, of course) and that they've never, ever

Actually, you can play a MOD in the background with basically
Zero slowdown (not zero, but quite quite quite small, as in
negligible- same with a modem connecion - just an ascii stream
that doesn't require mega-processing).

|> experienced a crash, so I won't).

|> + quite a few more that I can't remember offhand. The flow of games is
|> continuing into the next year as more 3rd parties complete their games.

Ah, the same thing happened last April... last summer... last Ocotober...
In fact, for almost this whole year!

Thing to learn here: Seeing is believing. ATARI is still having
some problems delivering the software, and if they don't deliver,

they are in trouble.

|> Jags are selling briskly,

Problem with that is: can ATARI make enough supplies? Looks
like this has been one of their troubles...

|> Atari is advertising, and many 3rd party

That one is very true, and I applaud ATARI in their
new entrance in the revolutionary concept known as marketing.

|> developers are nearing completion of their games. While Atari could be in
|> a better situation, it's not as bad as you think.

It is bad bad bad. If ATARI can't supply in enough quantities
Jaguar units + games... they will be in trouble. I mean: wasn't
500,000 Jaguar units be supposed to be sold by now? Even 300,000?
The real number is way below that.

|> : And how is Atari going to make a comeback in the computer market
|> : against the likes of Microsoft, Apple, and IBM with a machine

|> : itself is LOSING MONEY!!
|>
|> The Jag losses have gotten smaller and smaller by the quarter.
|> This quarter, Atari will likely turn a profit ... it is Christmas, you
|> know!

Will likely... interesting term. So maybe yes and maybe not.
I hope they do because I'll like seeing the Jaguar rise, but if they
continue losing money and time continues passing by....

|> : I hope Atari has a rabbit up its sleave because otherwise it's all
|> : over;
|>
|> A few rabbits:
|>
|> - The cross-liscencing deal with Sega

BIG DEAL. The only thing ATARI will get from it are
3-year old + SEGA games.

|> - Primal Rage

When is it out? Late 1995? There are a couple of intersting
titles in the works, the question is WHEN???!!!

|> - Williams Electronics can make Mortal Combat for the Jag in 1995

Again, BIG DEAL. Mortal Kombat II fever is already going out, most
copies with S-NES units... and the S-NES version is very very close
to the arcade.

If you are even talking about Mortal Kombat I, just forget it.
By the time even MK-II gets ported to the Jaguar, it would be just
too late. They better start thinking about Mortal Kombat III.

|> - The Jag network goes up

If ATARI can $afford$ it...

|> - The CD gets released, as do many CD games being developed by

Ah, you mean the CD unit that was supposed to be released for sure
last summer? And then you are talking about titles? Seeing is
believing. WHEN?!!!

|> 3rd party developers that Atari's been waiting on to complete titles.
|> - The Jag VR helmet comes out.

OH, yeah... WHEN?!!!! Spring of '96?

|> - Fight For Your Life is released

When?

|> - Atari introduces some new surprises at Winter CES 1995!

Like what? Like ATARI pins that you can clip on your T-shirt?
Sorry, but I couldn't resist being ironic. I don't see what
those surprises could be, besides the *final* release of
the JagCD.

|> - Ultra Vortex & Rayman are released.

When?

|> Atari will go the way of Commodore and Sinflop will have a
|> : big field day over it. Of course, without Atari to pick on Mr.
|> : Flop will lose is only reason to exist and will proabably promptly
|> : commit suicide in a fit of depression;
|>
|> Ahh ... we can only hope!

Source record: 14311

: |> 1. Cybermorph
- I disagree. Most people who sit down with it, find that it
grows on you.

: |> 2. Dino Dudes

: A lemming clone type. Lemmings fever is over
: since long ago.

- True. On the other hand, it is a fun addition to the library,
though it isn't a system seller.

: |> 3. Trevur McFurr

: One of the worst games done.

- Yep!

: |> 4. Aliens Vs. Predator

: Awesome game. One of the very few.

- Yep!

: |> 6. Raiden

: Good translation, but an old game.

- I agree. A XXXORXX should showcase the Jag better.

: |> 7. Wolfenstein 3-D

: Excellent translation, but Wolf
: fever has been kind of 'over'.

- It's selling pretty well.

: |> 8. Dragon

: Not really different from the S_NES version.
- Sigh. You're right.

: |> 9. Brutal Sports Football

: Mixed reviews... most peopole don't
: like it much.

- I've heard that it's fun, but not as good as other Jag games
and it's too expensive.

: Yes, but after a *LOT AND LOTS* of delays,
: and some of the games are really really bad.

- True. On the other hand, given Atari's size, they sure are
piping out a hell of a lot of games. How many other companies their size
release ten games a year.

: |> 1. Kanasumi Ninja

: People are fearing it would be bad after
: watching the latest video.

- So am I. The graphics look excellent, but we all know that
graphics don't make the game. Ultra Vortex looks like a better bet.

: |> 2. Club Drive

: Might be good.. but early reviews
: say it's not good.
- I'd personally enjoy it, but it's not a system seller.

: |> 3. Iron Soldier

: Probably good.
- Probably *EXCELLENT* ... the reviews have been outstanding!

: |> 4. Syndicate
: |> 5. Sensible Soccer
: |> 6. Cannon Fodder
: |> 7. Skiing
: |> 8. Bubsy
: |> 9. Zool 2

All of these games will be out by Christmas.

: Ah, the same thing happened last April... last summer... last Ocotober...
: In fact, for almost this whole year!
- You're right. On the other hand, the Jag is hard to program and
many companies haven't given top priority to their Jag games. Keep in
mind, a good game takes a year or more to program.

: Thing to learn here: Seeing is believing. ATARI is still having
: some problems delivering the software, and if they don't deliver,
: they are in trouble.

- True. Things are looking up, though. In the last two and a half
weeks, Club Drive, Checkered Flag, Dragon, Doom and Brutal Sports
Football came out.

: |> Jags are selling briskly,

: Problem with that is: can ATARI make enough supplies? Looks
: like this has been one of their troubles...
- Probably. IBM is big and Atari has to $$$ (courtesy of Sega) to
make more if needed.

: That one is very true, and I applaud ATARI in their
: new entrance in the revolutionary concept known as marketing.

- I never thought I'd see the day!

: It is bad bad bad. If ATARI can't supply in enough quantities
: Jaguar units + games... they will be in trouble. I mean: wasn't
: 500,000 Jaguar units be supposed to be sold by now? Even 300,000?
: The real number is way below that.

Actually, it was the end of 1994 that was the date mentioned. I
think 200,000 to 300,000 is a good possibility. The Jaguar already sold
100,000 units before the Christmas season started. Now they have
increased advertising and brought out more games.

: Will likely... interesting term. So maybe yes and maybe not.
: I hope they do because I'll like seeing the Jaguar rise, but if they
: continue losing money and time continues passing by....

Heh heh. People don't give the Tramiels enough credit. They may
not be great marketers, but they sure are incredible when it comes to the
survival of a company.

: |> - The cross-liscencing deal with Sega

: BIG DEAL. The only thing ATARI will get from it are
: 3-year old + SEGA games.

Where did you get this info? Nobody knows the true mechanics of
the deal. I've heard that anything is fair game except for Sonic games.

: When is it out? Late 1995? There are a couple of intersting
: titles in the works, the question is WHEN???!!!

True. Primal Rage was just announced. On the other hand, TWI is
making it (and they own shares in Atari), so I would imaging that they
wouldn't be too slow in producing it.

: Again, BIG DEAL. Mortal Kombat II fever is already going out, most
: copies with S-NES units... and the S-NES version is very very close
: to the arcade.

- Not in this part of the country. Besides, Mortal Combat can be
enhanced to take advantage ofJag power.

: If you are even talking about Mortal Kombat I, just forget it.
: By the time even MK-II gets ported to the Jaguar, it would be just
: too late. They better start thinking about Mortal Kombat III.

- From what I've heard, that will be the version to be released.
Although, this is a rumour.

: |> - The Jag network goes up

: If ATARI can $afford$ it...

- With TWI money, I'm sure they can.

: Ah, you mean the CD unit that was supposed to be released for sure
: last summer? And then you are talking about titles? Seeing is
: believing. WHEN?!!!

- Good point. I've heard that the CD ROM was delayed because
Atari wanted software for it. Makes sense. Perhaps we'll see the CD ROM
released with a bunch of games for it at the introduction point.

: |> - Fight For Your Life is released
: When?

- Early next year.

: Like what? Like ATARI pins that you can clip on your T-shirt?
: Sorry, but I couldn't resist being ironic. I don't see what
: those surprises could be, besides the *final* release of
: the JagCD.

Heh heh. Neither you or I are involved in running the company, so
we'll have to wait and see.

: |> - Ultra Vortex & Rayman are released.

: When?

- Early February. Rayman is almost finished and Ultra Vortex is
done testing. UV will probably be out in January.

: They are Mark. Unfortunately, they are unless they start
: delivering what they long-ago promised.

Well, I agree that work needs to be done. On the other hand, I
don't think that things are a total loss either. It's been a pleasure to
have an intelligent discussion with you! Merry Christmas!

I was an ST user for a couple of years, '90 & '91 to be exact, and dumped my Mega 2 for a 486DX33 with 8MB RAM, an 8-bit Soundblaster, and a Speedstar 24X SVGA adapter. It was a decent machine, but compatibility with the mainstream just became to large an issue. That coupled with the poor ST hardware and software support drove me to the PC platform. It definitely isn't that I'm a Microsoft lover... I just couldn't resist the increased software options at my disposal when slapping together my homemade clone for less than I'd paid for my Mega 2 with ICD SCSI host adapted & a ST251N(slow hunk of junk) just a couple of years earlier.

I'm really suprised to see Atari continue to push its Falcon line. I stepped out of the scene about the time the TT was flopping. Are any of these systems actually being sold, or even manufactured??? I've heard from scetchy sources that Amiga went bankrupt, but the videotoaster people were picking up the sytem under some kind of 'toaster workstation' label. Surely Atari will suffer the same fate if it doesn't strike gold with the Jag.

Sorry, enough bad stuff about the ST.

I'd like to hear some comparisons between the Jaguar and 3DO game systems. I suppose that comparisons with the Sega 32X are welcome, though I believe that this must be junk based on its nature. I hear the base processor for the Jag is a Motorola 68000??? Surely not! How can they hope to compete with 3DO by using an outdated CISC chip, albeit a well-designed one for its time. What are these highly-touted graphics coprocessors, and how do they stack up against the 3DO? By the way, is that 3D(O) (phonetically, three-dee-owe) or 3D(0)? I've played Road Rash for the 3D?, and it's far above the quality of any home game system I've seen. I'm eager to try Doom 2 for the Jag... I'm confident that it'll outperform my 486dx33, but I'd like to see the 3DO version also.

I hope I don't draw too many flames for 'Atari-Bashing', because I really like my ST. Today it's in my closet, but over the weekend I'll be configuring it and then delivering it to my 8-year-old brother as his first computer. Although it's unstable at times (like Win31), it served me well for 2 years... It may have been worth the 2K I spent on it, or maybe not. The main problem is still the incompatability. One of the last things I did was add a TEC TOS 2.06 upgrade, and at least that improved disk compatibility with DOS. If the world was running on STs, I'm sure I'd still use mine...BUT its not.

5114. Re: Saturn out - Jag DEAD

I just wanted to mention something that can make the
Jaguar hold its own (at least in the US) vs the Saturn.
Price. The price of the Saturn looks like it will be
in the $500+ area, something that tells me "it just
won't sell."

I think companies should realize by this time (and
I thought SEGA did, because they made a marketting
study on it) that a machine that costs more than even
$400 would have a hard time selling.

However, let's say that the 32x is out though, and
that could really give the Jaguar a run for the money.

>
> >*shrug* So Byte is staffed by incompetent writers...

I'd just like to inject something: I looked at the BYTE in question, and I found no indication that they thought the Mac OS does not have true multitasking. Which is correct, because it does multitask - regardless of how much people on this group want to restrict the definition of multitasking to just those operating systems with preemptive scheduling.

The BYTE article did point out that the comparative late arrival of a preemptive scheduler for the MacOS is a weak point. Copland, which will have somewhat limited preemptive multitasking, is not due to ship until sometime next year, and Gershwin, the first with a fully preemptive scheduling model, probably won't happen until '96.

In the meantime, there is the Thread Manager in System 7.5, which presents a way for threads that do not need to call most operating system functions to be preemptively multitasked. This should at least allow jobs like background rendering to take advantage of preemption, without resorting to hooking into a system interrupt.

I only been in the US for 1 month, I have seen, umm, 5-6 Jaguar ads on the TV.
How many X32 & 3DO ads have I seen? Maybe 10-20 times more (hope not 32X more!)
And for those Jag ads, I actually have to sit throught the ad section of a TV
program just to catch it (Ok, I'm one of those who switch channels during ad
sections).

I must say Atari really isn't trying very hard. :-c

|> Ah, you mean the CD unit that was supposed to be released for sure
|> last summer? And then you are talking about titles? Seeing is
|> believing. WHEN?!!!

Very soon. The CD has been in production for some time now. Atari was trying to release it by 12/31, but the software for the pack in is not ready (note that this is not something we can blame Atari for directly - the software is being done by 3rd parties and outside development houses). The software will be ready, oh, by the middle of next month, when Atari will release it with the recently confirmed $149 price. Pack-in has been decided, but remains a secret.

If you were using a falcon you could play a mod with even less
slow down, as most falcon modplay routines in the PD use the
DSP processor to do the frequency shifting & pipe it straight out
through the programable sound matrix to the DAC's without hitting the
main CPU bandwidth.....

Craig Graham.

You didn't ask me, but he probably used the "PostScript" printer driver in the Printer prefs and perhaps did some settings in the "PrinterPS" prefs editor. These prefs editors and drivers come since several versions (was it 2.1?) standard with the AmigaOS.

The zero slow down on the Amiga is just that, in fact once the mod is loaded
into chip mem the CPU doens't have to do anything with it again. Consider
that mods were first devised on the Amiga, they use the built in routines
of the chipset. If a player did not show any graphical interface that showed
anymovement then the cpu would never be used doing play time. The Falcon
will need to do some type of conversion, the Amiga needs non.

Which is pretty much the same way the Amiga does it. Tell the DMA
controller where the sample is, what pitch to play it at, and which
channel to play it through, and that's it. If you're willing to lose 6
lines of resolution, this can be accomplished with **NO** CPU drain.

The Amiga has used custom chips to alleviate CPU strain since the very
beginning. Remember that in future... :)

The Atari Jaguar is the best investment I've ever made! I had the chance to see the much touted SNES Donkey Kong Country over the weekend. I have to admit its cute, but the SNES itself is far inferior to the Jaguar. I firmly believe that Atari has a one year jump on the comptetition and they are determined to STAY in that position from this point forward. Tell your friends that they no longer need a $2000 PC to play DOOM, we have it for our Jag's, IN our living rooms, on our 27"+ SVHS TV's and in FULL surround sound! Way cooler than 14" PC monitors! Tempest 2000, Alien vs Predator and DOOM are reason enough NOW to invest in 64-bit future power. Tell your friends that more software is on the way. Guess I'm just one happy camper... And the $149 CD-ROM player is coming soon.

Of course its inferior - but it has a selection of great playable games
far in advance of that available for the Jaguar and will continue to sell
more games than the Jaguar ever will sell.

> I
> firmly believe that Atari has a one year jump on the comptetition and they
> are determined to STAY in that position from this point forward.

They _had_ a jump and wasted it. The Saturn is out now in Japan, the
Sony playstation is about to come out and you can get Sega 32Xs really
cheaply. Not for the first time Atari have blown it.

> Tell
> your friends that they no longer need a $2000 PC to play DOOM, we have it

But the PC version is LOTS better and most people have played DOOM to death
now on their PCs anyway.

> Tempest 2000, Alien vs
> Predator and DOOM are reason enough NOW to invest in 64-bit future power.

Not when 16 bit systems have games like Mortal Kombat 2, Earthworm Jim
and Donkey Kong Country. The Jaguars line up looks very weak indeed compared
to 16 bitters and the next generation of consoles like Staurn and PSX will
walk all over the Jaguar technically and with software availability.

> Tell your friends that more software is on the way. Guess I'm just one
> happy camper... And the $149 CD-ROM player is coming soon.

The CDROM was supposed to be out last summer.

I see from your username that you are an Atari fanatic. Fine, but just
remember that the general public don't have the same rose-tinted view
of Atari that you do.

And MPEG's originated on Unix, but the Amiga & Falcon are both better
at playing them than a HP Apollo700 (a dogs bollocks fast workstation).
What is your point?

>anymovement then the cpu would never be used doing play time. The Falcon

Then your mod player must be using a shit load of memory & storing frequency
shifted copies of each sample.

>will need to do some type of conversion, the Amiga needs non.

I think you missed the point there - the falcon architecture means that
the DSP chip has it's own local RAM, which it uses independant of the main
bus. For an amiga to play mods, all the processing done by the peripheral
chips has to be done over the main CPU bus, whereas the DSP can process
in it's own RAM, then pipe the results straight into the sounds matrix
without actually accessing the CPU main bus at all, hence my comments about
CPU bandwidth as opposed to CPU cycles. The DSP player uses much less
bus bandwidth than any Amiga player (remember, any time a custom chip
is accessing the main bus, the CPU is locked off the bus for that time)

So, the Amiga may have originated the format, but the falcon does the
business with it :)

No - it's not at all like the way an Amiga does it. You tell the
amiga chips where the sample is and they play it, using the main CPU
bus - just like a falcon or an STE can using the DMA sound system - old
technology.

What I described was the CPU giving the DSP the sample, the
DSP does freq shifting et al on that sample in it's own memory,
then pops it out to the DAC's without actually using the main CPU
bus at all - so there is NO LOAD on the CPU bus. Admit it, the
f030 modplay routines piss all over those for ANY other platform in
terms of bus loading.

>The Amiga has used custom chips to alleviate CPU strain since the very
>beginning. Remember that in future... :)

I didn't forget, but I think you are missing the whole point of the
falcon architecture - high speed data transferr & manipulation doesn't
have to go over the main bus. It's not a question of the load on the
CPU, it's a question of the load on the main system bus, which is a
totally different issue.

Craig.

Wake up kids, floppies are obsolete. In the real world things are networked, file sharing/transfer is all done over the network (as are SW installations). On those rare occasions when somebody actually needs a floppy, you can usually find some in the recycling bin. So yeah, every couple of months my mac has to stop whatever it's doing to format a floppy. Who cares?

All I know is that while I was typing this I received two e-mail messages (while printing a very large report in the background somewhere). That's a lot more than my ST can do.

As long as the size of the MOD player DSP code plus the size of the sound
samples plus the size of the note data doesn't exceed 96 KB - somewhat
unlikely, IMO. Falcon MOD players undoubtedly have to do lots of
shuffling of samples between DSP memory and main memory, since DSP memory
is so limited in size.

To pick the nit, they actually do: if you're on a 660AV or 840AV, the DSP can be running a preemptive kernel called ARTA, which allows multiple DSP tasks to run at once. ARTA is pretty much independent of the Mac OS, of course. Also, I'm fairly sure that the Sound Manager gets to pass off a lot of jobs to the DSP that would normally be handled by the CPU (averaging several digital signals for output through the single codec, for instance).

: for instance).

The ARTA approach allows the AV-Macs to execute two seperate tasks-
called "Realtime" and "Timeshare" - at the same time.
Realtime events, such as sound and video input/output, do not use
all the bandwith of th DSP. When doing asynchronous functions like,
modem emulation or image compression, this can be done using the
large bandwith of the DSP, cooperatively with the CPU...
Theoretically DSP coprocessing gives the Mac the ability to run two
tasks simultaneously, aslong as the one of the tasks is some kind of
AV signal processing.
The Mac's still are not able to handle two cpu-intensive tasks
effectively at the same time..

Cheers...

1650 cps with a v.32bis connection, normal .zip style .sit file. In other words, exactly what it is on the Amiga. And 28.8k modems are roughly double that once line limitations are taken into account. There is no slowdown.

>> Can you also use your StyleWriter (print) while you continue downloading?

There is a problem with Localtalk communication. With Ethertalk there is no problem.

This is done on the theory that if you are rendering, you wish to be done
as -soon- as possible, hence nothing should run that might slow things.

Modem downloads and modplaying isn't a problem.

>There are major flaws in the way that the MAC multi-tasks, it does multi-task
>it just doesn't switch between apps intelligently or frequently enough.

Multitask that Amiga and any game. I can do exactly that with my Mac and
95% of the games out there, all of which would allow a 28.8k download and
gameplaying at the same time.

Both systems have flaws. Mac multitasking is far from perfect, but I gave
up Amiga multitasking in order to get the best apps available for any
computer when I got my P60 and Q700. Multitasking does not a computer
make. I run it for apps, not to see how fast I can hit Amiga-M to flip
between 20 screens.

No, no, no, no, no. The Amiga has TWO CPU buses - one for CHIP RAM, the
other for FAST RAM. The CHIP bus is shared with the custom chips, and
the FAST bus is solely for the use of the CPU - assuming you have
some FAST RAM installed, then playing a sound doesn't slow the CPU down
at all.

>>The Amiga has used custom chips to alleviate CPU strain since the very
>>beginning. Remember that in future... :)

And, like I said, playing a sound DOESN'T load the CPU bus... Try it
some time - run PerfMon and a decent MOD player, and the only CPU drain
that will show up is a few instructions every few thousand cycles to
re-load the DMA registers.

Well I guess a good start would be a Mac that while ftp'ing, wouldn't
slow to a crawl when you are loading something, or even better when you
have an application in front of Fetch or Netscape or whatever you use.
Let see I can stall the download by loading anything. I can make it so
slow that I can watch the k transfered counting up just by having an
application sitting in front of it. This is all over ethernet. How come
Mac ethernet connections are so much slower than other computers. I
think that one main reason is the lack of pre-emptive multitasking. You
know the kind that when you save to the disk it doesn't stall the ethernet
connection. Anyway, I guess this may not be a customized, modern Mac that
I use everyday (Quadra 650, PPC's, etc).

Also before you rip me apart, I more than likely will switch from the Amiga
to the Mac once they get something that I consider pre-emptive multitasking.

Later,
Rob Morton

Well this may be true, but IMHO waiting a few more seconds for a render and
still being abel to other things is in the best way to go. Besides what is
the user supposd to do while he render goes on? Play with the pencil
on their desks, or use another computer (given that they had one)?
Personally if you think that the render sceem was done on purpose then
so be it but it was a dumb idea.

In fact to tell you the truth if i were running to apps on the Amiga the
total amount of time both tasks would tkae up would be less than if I waited
for one to finish and started another.

: Modem downloads and modplaying isn't a problem.

: >There are major flaws in the way that the MAC multi-tasks, it does multi-task

: Multitask that Amiga and any game. I can do exactly that with my Mac and
: 95% of the games out there, all of which would allow a 28.8k download and
: gameplaying at the same time.

What type of MAC do you have? Besides the terminal programs on the MAC
totlaly suck IMHO compared to some on the AMIGA. Besides another thing is
that if I were to have a game that actually allowed multi-tasking on my
Amiga then it would run and perform much better than on a MAC.

The OS on the Amiga is much better at multi-tasking than the MAC's is.
Were not talking about application availability just straight OS performance.

: Both systems have flaws. Mac multitasking is far from perfect, but I gave
: up Amiga multitasking in order to get the best apps available for any
: computer when I got my P60 and Q700. Multitasking does not a computer

: between 20 screens.

Well my Amiga suits me quite well and if there isn't a praticular app
that I like on the Amiga then I just fir up my Emplant. You software
availability is completely and totally moot in this instance.

Hmmmm... then why Supra had a warning about using their 14.4k
modems in the manual when using a Macintosh, and doing other
things at the same time? As in communications could be interrupted?
And what about Supra's 28.8k baud modem? I surely wonder...
But then, there's System 7.5 out there now, so maybe they changed
something.

You won't get flamed by me, as I agree with your comments. I wouldn't
say though, that Amiga users are "the most immature" or something.
Just look at some Mac users and PC users :-) There are immatures
everywhere.

No no, the CPU can do a lot of other useful things during this.

>I think you missed the point there - the falcon architecture means that
>the DSP chip has it's own local RAM, which it uses independant of the main
>bus. For an amiga to play mods, all the processing done by the peripheral
>chips has to be done over the main CPU bus,

No no again: This is why we distinguish Chip RAM and Fast RAM in an Amiga.
If an Amiga has both, then the custom chips can play a MOD, and the CPU
can access Fast RAM without any interference. This is exactly the same
as "local RAM for the DSP", but here it's called "Chip RAM for the custom
chips".

> The DSP player uses much less
>bus bandwidth than any Amiga player (remember, any time a custom chip
>is accessing the main bus, the CPU is locked off the bus for that time)

You obviously have some misconception of the Amiga architecture.
Admitted, if an Amiga (500 or 1200 base version) doesn't have any Fast
RAM, this advantage disappears completely, but every Amiga is
expandable with Fast RAM, so the architectural quality exists in every
model.

>So, the Amiga may have originated the format, but the falcon does the
>business with it :)

No better than the Amiga! But perhaps in this regard also not worse
than the Amiga.

Oh, great blame the community for no Jagflops..There are plenty of Sega's, Nintendo's and 3do's.. Whats with Atari? Even the new Sony Play Station will beat the Jagflop to my lake of the woods..

It doesn't matter with the local availability of the Jagflop anyways because it's DEAD unless there is a huge price reduction...

You seem to misunderstand the way Amiga games work, eh? Any game on the Mac which has an Amiga counterpart and is OS compliant will more than likely be OS compliant on the Amiga as well. ANY OS compliant (Workbench "runnable") game will allow one to use the OS running other tasks and play the game at the same time. The types of games that DO NOT multitask (run under wrokbench) are those that the Mac platform doesn't even have any substitutes for! These games are faster ARCADE style games like Street Fighter etc... What the heck kind of action game can you play on a Mac?? Can you even get a joystick or do you have to try and play pac man with a keyboard or mouse? It is a pitiful argument to bring up gaming between the two systems because you run into problems on a mac to play arcade quality games of old such as Pac Man much less the newer style arcade games like Street Fighter and Mortal Kombat. OK, I realize that you will probably come back and say well, "I like to play games like Myst because Arcade games just aren't intellectual enough"... But the fact of the matter is, the Mac doesn't have any decent arcade style games and furthermore, the games that ARE like Myst for the Amiga will happily run along in the background with a download or whatever going on.. Heck, the games on the mac don't require any real processing power to begin with! What do you need? An animated pointer, a picture, and some text? Give me a break! Yes, I realize there are more complex games, but nothing to the code complexity and cpu intesity of typical Amiga arcade games. Oh well, every man to his own.....

First let me say that I am a very happy Jag owner. I'm not a
Jag or Atari basher. Now with that out of the way . . . :)

This month's Electronic Games issue just arrived. It has a
full-sized packed-in "3D0 Cristmas buyer's Guide". No Jaguar Buyer's
Guide. EG has routinely neglected the Jag. Oh, and this month's issue
also has an interview with Trip Hawkins. No interviews with Atari
people.
Very depressing.
Just wanted to mention this in response to your statement about
the media giving it good reviews...which is no doubt true as well, but
this provides a counterpoint. Unfortunately. :(

If it is true that the Jag is outselling the 3DO in the U.S.,
I wonder why EG has chosen to pan it?

How long has it been since you've used an Amiga? It seems that it
has been sometime. There are many more well written app out there
for the Amiga than you seeem to think there are.

Yours is a case of ignorance, there is nothing wrong with that. How
are you to know about apps for another platform anyway? But the small
fact is, if you know what you want you can find it for the Amiga.
Almost. :-) That's were Emplant takes over....

yes I am sure about the games, I am not a game fanatic, in fact I barely
have any games on my computer (amiga) I have tons for the Emplant Mac
though.

Yes I agree, if one were to go out and buy a machine from scratch. The Amiga
way and Emplant would not be cheaper than a PowerMAC, but then again
it would definetely matter if the person needs video, since the PowerMAC's
are expensive in that arena compared to the Amiga.

Besides what is wrong with getting an A3000 (that's what I have) The A3000
is inexpensive now (used yes but still quite capable). Alot of this
is actually not worth talking about, who knows the Amiga may not come to
life again, and it may just come back stronger and better than before.
But I personally like the way the OS was done, and the way some of the
hardware was put together. It suits my needs and outperforms all of
my friends machines (Mac Centris 650, and a 486 66 with Windows) in
all areas. Barring a few specialized ones. (Games in particular)

> Oh well, every man to his own.........

Simply put, you show a tremendous ignorance of the Macintosh gaming market.

Here are just three examples, two of which are commercial and the remaining shareware:

Maelstrom - Excellent Asteroids "clone" using 256-color sprites instead of vector graphics; it can handle tons and tons of sprites on the screen on my Quadra without slowing down (no idea of exactly how many, since I'm far too busy blasting asteroids and alien ships at that point to count). Shareware by Andrew Welch.

Marathon - not yet in release, but a public demo is out. Basically, a Doom clone for the Mac, but better than Doom, especially on a Power Mac. Excellent action game to begin with, and the game actually has a semi-believable storyline if you play single player. Or just lots of carnage if you link several Macs and play it networked with your friends. By Bungie Software.

F/A 18 Hornet - Very good polygon flight sim. Does 20 fps at 1152x870x256 on my Quadra. The only flight simulator I've seen which really tries to

simulate a real military aircraft, down to the cockpit instruments. By GSC Simulations.

P.S. Yes, you can attach a joystick to a Mac quite easily. Since many games don't support a joystick directly, joysticks can be set up to emulate keypresses, allowing any game which uses keyboard control to be played with a joystick.

P.P.S. No, the Macintosh does NOT have problems running even the simplest arcade games like Pac-Man.

It depends a lot on the terminal program you run. Some terminal programs
use methods of getting CPU time that do not depend on the cooperative
multitasking model (they hook into something like the vertical blank
interrupt). They have no problems doing full speed downloads while
something like Marathon is running, simply because they do not rely on
cooperation. Similarly, there are background MOD players for the Mac
which cannot be interrupted by pulling down a menu, etc. There is more
than one way to skin a cat, or, in this case, to get CPU time.

You obviously haven't surveyed the Macintosh game world in some time.
Macs are perfectly capable of handling Pac Mac, not to mention more
modern games like Marathon. Your statements make you look like
an imbecile.

Joseph Crowe <jcrowe@mpd.tandem.com> wrote:
> Depends on the game. The real problem with co-operative multitasking lies
>in the fact that the burden of scheduling falls implicitly on the application.

Correct. To elaborate, since it may not be obvious why this is bad, scheduling is a global problem. The amount of runtime a program should get each time it is given the CPU depends on the state of every other program that is runable.

A cooperative system as done on the Mac requires each application to make scheduling decisions, but does not provide the applications with the necessary information to allow them to make good scheduling decisions. For the most part, all the applications can do is call WaitNextEvent a lot, and hope for the best.

I used to run a program that did a lot of computation. If I had it go through its event loop fast enough to prevent visible slowdown of other applications, the computing only went about 1/3 as fast as it did if it only went through the event loop once every several seconds. Now I'm running A/UX on my Mac, and my program runs on the Unix side of things rather than the Mac side: the event loop is gone, and it runs at 95-99% of full speed and has no noticable effect on most other programs.

: You obviously haven't surveyed the Macintosh game world in some time.
: Macs are perfectly capable of handling Pac Mac, not to mention more
: modern games like Marathon. Your statements make you look like
: an imbecile.
FIrst off, I don't think you read what I said very well, I mentioned high paced arcade games like Street Fighter and Mortal Kombat. I realize you can get Marathon, yet another clone of a very over rated game. AT any rate, that is not the type of game that I mentioned, is it? How many games in an Arcade are like DOOM? I haven't seen any that were very popular. Come to mention, I don't remember seeing any at all. At any rate, the comment about Pac Man was aimed towards the lack of true joystick input. Believe me, if somebody actually wanted to play Pac Man, the keyboard or mouse simply does not suit the purpose well. Also, I suggest you look into the Amiga gaming market also. There aren't many quality games left but the ones that ARE still better than other platforms are the basic arcade high speed action ZOOL type games. I still haven't seen anything of any quality similar on a Mac. Yes, I have looked into Mac gaming recently. I am not easily impressed, as a matter of fact, it is DAMN hard to impress me with a game. The point of the matter is that the Mac, no matter how much you do not care to admit it, does and has always suffered from a dearth of decent Arcade type games. The Doom, virtual world type games just don't cut it. If you were to try it out in an arcade, I doubt it would gather much attention as the gameplay is VERY basic... You run, point and shoot... not much for variety would you say? Also, flight simulators are NOT arcade type material. Flight simulators have been on EVERY system dating back to the TI99 even. I will admit that my Amiga doesn't get much use anymore as it has just gotten too dated and I primarily use a 486/66 with 64 bit graphics to suit my needs in college more. I find the AmigaOS a nice environment. I find the IBMs very easy to build with high quality and low prices. I

find that simple arcade games like Pac-Mania and Zool for the Amiga generally have better gameplay than those on the IBM. I notice that IBM games are better when the game becomes more complex like Wing Commander or <choke> Doom. On the Mac, (I use a PM 7100 fairly often) games are just not aimed towards the higher octane arcade games but rather towards slow, graphics intensive, mouse based games like Myst. I tire of seeing Mac advocates say their machine is better for any purpose remotely thinkable. Have a little character and admit that the Mac just is NOT a strong gaming platform!

: > with a keyboard or mouse? It is a pitiful argument to bring up gaming

: Simply put, you show a tremendous ignorance of the Macintosh gaming market.

Do we have to use such harsh words? Sheesh.. at any rate.. let's begin.

: Here are just three examples, two of which are commercial and the
: remaining shareware:

: Maelstrom - Excellent Asteroids "clone" using 256-color sprites instead of
: vector graphics; it can handle tons and tons of sprites on the screen on
: my Quadra without slowing down (no idea of exactly how many, since I'm far
: too busy blasting asteroids and alien ships at that point to count).
: Shareware by Andrew Welch.

OK.. You got me, you DO have a simplistic pacman level game for the Mac.
but, you know what? I have a game almost exaclty like that for Windows
on a PC! Geez.. if you think that is what is "arcade" quality nowadays,
I must've overestimated the average user's knowledge of gameplay...

: Marathon - not yet in release, but a public demo is out. Basically, a
: Doom clone for the Mac, but better than Doom, especially on a Power Mac.
: Excellent action game to begin with, and the game actually has a
: semi-believable storyline if you play single player. Or just lots of
: carnage if you link several Macs and play it networked with your friends.
: By Bungie Software.

OK, another Doom clone... something special about it? Notice, I did not
mention DOOM in my message because to be honest, if you like DOOM type
games, the IBM platform will be ahead of the Mac forever and the Amiga
platform only has one or two clones. At any rate, I stand by my point
that if you put DOOM in an arcade, it would not gather much attention as
it is just not very playable. It doesn't keep your attention, you don't
do anything except run around in a virtual world and shoot things. Great
for a PC, but not for the arcade.

: F/A 18 Hornet - Very good polygon flight sim. Does 20 fps at 1152x870x256
: on my Quadra. The only flight simulator I've seen which really tries to
: simulate a real military aircraft, down to the cockpit instruments. By
: GSC Simulations.

Do you really think that a Flight Simulator is an arcade game? I guess you must've been thouroughly impressed with Falcon when it came out then? The existence of a Mac flight simulator is no big deal. I think that F/A 18 Hornet has been available for the IBM AND Amiga for a while though. If I am correct (I am not sure if I am or not), I would go to say that the game play on your Quadra is no better than an A4000 (68040 vs. 68040). I would almost say that the A4000 would run it better but I won't hang myself like that since I don't know anything about the game other than I saw it and left it because I don't find much interest in flight simulators, the concept is too old. After years of looking at flight simulators and playing various ones, I got fairly tired of all of them. All of the quality F/S play basically the same, slow and methodical. Not an arcade game.. Only flight simulator to ever do well in an Arcade wasn't even a true simulator (Afterburner).

: P.S. Yes, you can attach a joystick to a Mac quite easily. Since many

OK....

: games don't support a joystick directly, joysticks can be set up to
^^^^^ ^^^^^ ^^^^^^^ ^ ^^^^^^^^ ^^^^^^^^
That is what I figured...

: emulate keypresses, allowing any game which uses keyboard control to be
: played with a joystick.

OK....

: P.P.S. No, the Macintosh does NOT have problems running even the simplest
: arcade games like Pac-Man.

This is nice even though my accusation of having problems running Pac-Man wasn't aimed at the game play of the ORIGINAL pac-man but, it was rather an attack on the virtual unavailabillity of TRUE joystick support. I suppose the keyboard thingy might work well though...

I don't think you showed a whole lot to disprove my point of mac gaming lacking in Arcade type games. Notice what is popular in arcades? High paced, action games like MKII, SFII, NBA JAM, etc... Games where you have to discover and use different joystick/button combinations and strategies.. I admit the pacman thingy isn't very prevalent in arcades anymore but the fact of the matter is that the Mac has little that would be profitable in a true coin-op arcade. The Amiga has always had the capability of being an arcade machine as that is what its original intent was. The machine was designed to be the worlds best programmable arcade machine. Something like the NEO-GEO is today I guess.. Yes, there WERE games on the Amiga that were direct ports from its arcade counterparts...

^^^^^^^^^^^^^^^^---irrelevant
>re-load the DMA registers.

Of course it does you pillock. CPU instructions != bus loading.
The machines performance in a system where lot's of chips are accessing
main memory over the same bus (like they are in the Amiga & most of the
falcon (with the exception of the DSP subsystem)) is determined
by the available bus bandwidth. 'coz even though the CPU may not be doing
any work to play the mod, if it still needs access to main memory it
will not be doing anything else as two chips cann't access the bus
simultaneously (you'd need dual ported ram to get simultaneous memory
access like they use in video cards & it costs a fortune). An easy way to
show this on your amiga will be using graphics modes. Disable your fast RAM.
Set your best video mode (I don't know, say 800*600*256 if the amiga
can handle it). Compile a program & time it. Now do the same in a real
low res with few colours. Compare the timings. Same number of instructions,
but because of the bus loading by the video system the machine is running

slower. The same applies to the sound system playing mods.

You seemed to be saying that the Mac's very architecture totally prohibited it from playing any kind of arcade game. I pointed out a game that demonstrates it can handle exactly the kind you're so enamoured with - lots of sprites.

Who the hell cares about arcade games? I play Doom-type games because when they're networked, they make awesome multiplayer games and I don't have to drive for two hours to get to a Virtual World.

Nope. Falcon looks like a toy compared to this one. I've never liked Falcon much.

It is not available for anything but the Macintosh (and soon there will be
a Power Mac version as well).

It will play better on my Mac, since I have the capability to display
1152x870x256 at 75 Hz NI built in, while an A4000 would be stuck with
whatever nasty interlacing it has to do to get 1280x400. If you stuck a
graphics card in the Amiga to rectify this, the game probably wouldn't
work with it, since the Amiga lacks device-independent graphics (as I
recall, RTG wasn't done when Commodore bit the big green banana of death).

Don't make the mistake of judging an entire platform just because the
style of games written for it doesn't comply to your own preferences. It
does not mean that that platform cannot handle the games in question, it
just means that they aren't written for it.

One traditional problem which has been a factor in porting games like
Mortal Kombat is that the Mac doesn't have color video modes below 640x480
as a standard thing. Updating the whole screen at high frame rates gets
kind of tough when each screen is about 300 K.

Like, say, Rampage? There's a *dinosaur* of a game.

The days where an Amiga was really the equal or better of the hardware in arcade machines are long gone. You could probably make that claim for the Power Mac, though; although it lacks lots of custom sprite hardware that's in sprite type games, it more than makes up for that with simple brute processing power. I'm not saying that anybody would actually build an arcade machine around them, because nobody would (it's probably cheaper to use hardware designed to be an arcade machine), just that it's as powerful as a lot of modern arcade consoles. Probably outpaced by the custom hardware in the latest 3-D racing simulations, though.

In article <3ccpo2$hiv@cville-srv.wam.umd.edu> morton@wam.umd.edu (Rob Morton) writes:

Well I guess a good start would be a Mac that while ftp'ing, wouldn't
slow to a crawl when you are loading something, or even better when you
have an application in front of Fetch or Netscape or whatever you use.

I have done a lot of downloading on an IIsi (20mhz 030) and
putting fetch in the background does not affect the downloading
speed in anyway as long as you don't start up a new app or
start a big rendering scheme that does not use Thread Manager.
(as an example)

Let see I can stall the download by loading anything. I can make it so
slow that I can watch the k transfered counting up just by having an
application sitting in front of it. This is all over ethernet. How come
Mac ethernet connections are so much slower than other computers. I

Have you ever checked what kind of routers, or hubs or whatever
that holds the Mac-enet together? Here at the school where I attend
my studies they switched the Routers this summer. The speed of
local ftp raised from ~4k/s to ~50-100k/s and remote ftp from ~4k/s
to ~20k/s.

think that one main reason is the lack of pre-emptive multitasking. You
know the kind that when you save to the disk it doesn't stall the ethernet
connection. Anyway, I guess this may not be a customized, modern Mac that
I use everyday (Quadra 650, PPC's, etc).

Also before you rip me apart, I more than likely will switch from the Amiga
to the Mac once they get something that I consider pre-emptive multitasking.

I fully agree that pre-emptive MT is something that is needed
(and coming as well). IMHO the cooperative MT is OK for my
purposes and not as bad as many people say it is. But yes,
it could be better.

I will grant you the fact that Amiga was a cool machine with lots of great custom chips made for graphics. But it does not change the reality. Unfortunately, Amiga is dead, and a lot of great technology went down with it. The closest thing you come to an Amiga now is the Macintosh, with AV features. Or you can buy a pc and help bill crush down more great technologies. So, instead of arguing about which is better, teh Mac or the Amiga, you guys should get together and help beat the evil empire.

Mahesh Soori.

The virtual world games are only interesting because you can INTERACT
with other players on a network. Until arcades come with
networked 4-8 machines all running the same game, these types of
games will not be successful.

How many Amiga games support multiplayer over a network?

I was watching the UK show `Movies Games and Videos' at the weekend.
Its basically just a platform for film and video game promos that doesn't
really venture to review things. Anyway, they did a rundown on the new consoles
available this christmas and really trashed the Jaguar. They pointed out that
the system was technically very good, but that Atari had flopped on software
support. Eg they showed Donkey Kong Country on the SNES and asked why Atarui
had bothered with Raiden.

Unusual for them, but it does illustrate how Atari have thrown away the
chance of Jaguar success.

gavan

PS I've also seen many of the newspaper 'video game pages` trash the Jaguar
for exactly the same reason here in the UK. I don't really think the Jaguar
has a prayer of succeeding here now.

Well, we all know that the first year of a product can be used to judge the overall success of a product, right? I mean if Fight for Life, Ultra Vortex, Rayman, etc. all turn out to be great games then I guess it does not matter at all. After all the Saturn is already out in Japan. It is all over now. Gavan has decreed that the Jag will fail and so it will. Hail almighty Gavan!
Not any knights rushing in to save C= to talk about, Gavan?
Also I guess good press on Good Morning America and in the Washington Post don't mean much.

Well, NewTek probably are the only people who have Amigas for sale at the
moment, but they're not all that involved in the bidding for the remains
of CBM. They were (I think) involved in a consortium that dropped out of
the bidding a long time ago, and the only remaining bidders are CEI (the
world's largest Amiga distributor, based in Miami) and CBM UK, probably
the best run division of C= Intl.

>Sorry, enough bad stuff about the ST.

Ok, I've seen the Jag and 32X versions of DOOM, and they're all more or
less identical to the PC version. I was actually more impressed with the
32X version, mainly because it was running on such a crappy machine.
I've yet to see DOOM on a 3DO.

(The 32X actually looks like it may be a contender - I was eager to
dismiss it as a shoddy stop-gap measure, but VirtuaRacing looks damned
good on it, too...)

>>systems. I suppose that comparisons with the Sega 32X are welcome,

IMO, 3DO is a much better system than the Jag at the moment, the Jag just
doesn't have the software, and with 4-5 new next generation systems
entering the video game war, the Jag, it seems, will be left behind. I
just don't think Atari has the money or the developer support that 3DO
does. Another advantage of 3DO is that it is an expandable standard,
produced by Samsung, Sanyo, Panasonic, Goldstar, and Creative Labs. 3DO
will be releasing an upgrade module in the near future that is *backward*
compatible with all current software, unlike Sega's Saturn & 32X. The
games for 3DO right now are better than *anything* else, IMO. Road Rash,
The Need for Speed are two excellent racing games, John Madden Footbal,
FIFA International Soccer (wow!!) are also two very good sports games,
with NHL '95 coming soon from EA Sports. Then there is Samurai Shodown,
Super Street Fighter 2 Turbo with almost 1:1 arcade conversion quality.
DOOM & DOOM II are being ported by Art Data for the 3DO, including a few
FMV clips to give DOOM some sort of plot & story line. Supposedly, Art
Data is redoing the graphics to take advantage of the 3DO.

As far as the 32X, its a quick fix, but will quickly fade to the 32/64 bit
systems available now & in the future, IMO.

One of the things I really hope is that 3DO succeeds. I would love the
opportunity to buy a video game system that has different models for
different people. For instance, a 3DO with a CD cartridge to hold my 10
favorite 3DO games would be nice. Remote control controllers would also
be nice. The fact that anyone who has the money can build a 3DO system,
gives the consumer a choice to pick the type of console they want, a low
end 3DO or a high end 3DO?

Gee, if you could've quoted where I said Mac gaming SUX, I would believe those words you tried to put into my mouth. Now, Mr. Wong, you have always seemed to come up with off the wall comments due to your seemingly consistent over reacting to things. If you go back and read what I originally said, you would notice that I merely pointed out the near non-existence of quality arcade type games on the Macintosh. If I said once that "Mac gaming SUX", I apologize. However, after re-reading what I said, I know that I did not say that. At any rate, I am waiting for somebody to prove my point incorrect. SO far, all I have gotten were replies like yours, which, in my opinion, do nothing for the apparent lack of arcade quality games on a Mac. If you want to prove me wrong, show me the light as they would say. Point me towards some quality arcade games for the Mac. I enjoy arcade games as well as RPG games and the whole lot of 'em. Any decent game is great to get your mind off of things when you have an exam or report you have been working towards for hours. Scenario1: Mac user is tirelessly working on a term paper in Write Now! for the Macintosh. He gets frustrated because his last paragraph sounds like total crap and he wants to take a break and vent his frustrations in a game so he doesn't go insane. He pulls up.... umm... Tetris?
Scenario2: Amiga or IBM user is tirelessly working on a term paper in their favorite Word Processor when they become frustrated due to their lack of a good closing paragraph for a section. Nothing seems to sound right. They take a break to vent their frustrations and get out of the "term paper" zone for a while to recoup. They pull up Mortal Kombat or a derivative and happily beat the brains out of their opponent until they feel 100% better and no longer frustrated.
I find these "kill the man with a face" games much more relaxing in tense situations than games which require thought because it was too much thought that sent you to the gaming world in the first place. Now, I must admit that games like Tetris, Myst, Flight Simulators and such are nice when you are in an already relaxed mood just trying to pass the time away or whatever. At any rate, I will repeat my point, not to be misinterpreted again. There are HARDLY ANY ARCADE QUALITY GAMES for the

Macintosh. Macintosh gaming was never accused of "sucking".

Dan

I have them all going AT ONCE. Doesn't that tell you something? ie I can do exactly that?

> Let see I can stall the download by loading anything. I can make it so
> slow that I can watch the k transfered counting up just by having an
> application sitting in front of it. This is all over ethernet. How come

No, you cannot do that. I think you have a very limited familiarity with the Macintosh. An application being in front doesn't slow things, even on my ancient IIfx with an ethernet connection, and an app being in front -definately- doesn't slow things on my Q700 at home with a 28.8k internet connection.

I couldn't wait that long, darnit. :) Anyway, some of what you've written is true - Mac multitasking does have a few things to learn from the Amiga / OS/2 method, but overall it works very well. I think some of what you are saying is wrong - especially that which I've pointed out.

What do you want to see? I don't format floppies anymore, so that's out.
I do download and upload at 28.8k frequently, and that's flawless with
MacIntercomm, my terminal of choice. Printing works great and I can
easily do other things while doing so. Playing games never takes down the
system, and I never need to reboot after games like I do on the Amiga.
So, what's missing? Granted, long computations can lock the machine
(Photoshop comes to mind) but I don't use that. If I did, I probably
would find that annoying, but that's what I've got a Pentium for - big
computations, a category in which I feel the older Motorola chips have
never done a good job at.

Well, *IF* you don't know what "RUN" does, and *IF* you break into the
startup-sequence immediately after boot, then with most (but not all)
IFF8SVX players (sound players) on the Amiga, you would not be able to
multitask.

There...that makes about as much sense as the post two paragraphs above.

In the Amiga vs the Mac debate, I'll say this. The Amiga was far more advanced and gave an incredible amount of bang for the buck when it first came out. Still does an amazing job of bang for the buck even compared to modern machines. In some ways, especially so considering how effciently the Amiga uses its resources. In its specialty, graphics and to a lesser extent music, it is still the best system on the low end. (depending on how you define the low end, its often the only system on that level)

On the other hand, the Amiga had some problems with it as well. While the original Mac had more expandibility problems than the original Amiga, if I remember correctly, they fixed the expansion problems in the Mac over time, while the Amiga's expandibility was never quite at the same level as that of the Mac or PC machines. Also, the efficiency of processing power and graphics power was achieved at the cost of flexibility. Quickdraw may not be as efficient as talking to the Amiga chipset, but you could upgrade the hardware behind the software without blowing up your programs.

The Mac did and does have problems with limits in the operating system that Apple is still trying to undo today. Then again at least they have a timetable for undoing the damage. Does the Amiga have protected memory? Will it ever have protected memory?

In short, the only advantage that the Amiga is likely to retain over time is its efficiency to do a lot more with fewer resources. As said resources get cheaper and cheaper, that means less over time. Of course, a lot of this depends on who buys the Amiga chipset and what they do with it. While the Amiga chipset is astounding, the rest of the industry has been busily working on catching up to it, and I doubt seriously that any future Amigas will be that far in advance of the rest of the industry. With all of the money to be made duplicating the Amiga's prowess on the PC and Mac platforms, there's a lot of incentive in doing it.

if if if. All these great games waiting to be released. Sounds just like
last year.

> After all the Saturn is already
> out in Japan. It is all over now.

Well, with both the Saturn and (especially) the PSX looking miles better
technically than the Jaguar, and with the wealth of good software support
these machines are getting things look really bad for Atari.

They had their chance. The Jaguar was for a year the most advanced console
and atari threw it away by failing on software support. No surpises there
I`m afraid.

> Gavan has decreed that the Jag will
> fail and so it will. Hail almighty Gavan!

The point I was making was that nominally neutral media shows were
trashing the Jaguar based on the lack of software. I and others have been
predicting this ever since the Jag came out, based on Ataris abysmal history
of software support and marketting.

> Not any knights rushing in to save C= to talk about, Gavan?

Just CEI and C=UK management teams dragging out the bidding for the
technology. It's getting to the point where Amiga users have had enough.
My next machine will probably be a PCI Pentium, but then that was the case
anyway. For the forseeable future however, the Amiga does me just fine
with good soft and hardware support.

> Also I guess good press on Good Morning America and in the Washington
> Post don't mean much.

Maybe the Jaguar will suceed in the US. In Europe, its flopping badly.

Debatably better technically at best. We _still_ don't know what the Jag is
fully capable of.

> The point I was making was that nominally neutral media shows were
>trashing the Jaguar based on the lack of software. I and others have been

5207. Falcon future...?

Newsgroup: comp.sys.atari.advocacy
Date: 1994-12-13 11:45:12 UTC
From: etlsney@etlxdmx.ericsson.se
Message-ID: <1994Dec13.114512.25406@ericsson.se>
Source record: 14206

It was announced recently that CLab have bought the rights to the Falcon. Hmmmmm, well, thats good and bad news for me as my only interest in computers is in their music-processing abilities/D2D recording etc..

I understand that Protools-16 on a Mac costs around $10,000 and that the new Falcon (still under development) will run Clab and/or Cubase Audio and sell for around $2000.

Is this true? or just rumours?

Anyone heard of New Falcon developments/ specs?
will there be a rackmount version?
Will it be able to run any PC software (albeit slowly)?

s./

And what did they have to say about the 3DO, playstation and Saturn????

As of now, even a 3DO is a much better bet than a Jaguar, and just look
at Ridge Racer out NOW on the PSX to see what it is capable of.

I think these guys are partially correct.

I was a commodore guru way back (eventhough the Amiga is 1/2 commode 1/2 atari). Commodore had its own Chip Fab (Mostek)... they knew hardware. Commodore constantly did spiffy things in hardware, had sub controllers doing everything, etc. I like commodore hardware... I had one of the first Amiga's (I was bootstrapping my machine alot). But commodore didn't know how to market, design an OS, or support a computer.

Hense... they are out of business.

Apple on the other hand did everything in software. Which I thought was bad. (Why I traded in my Pet for a C-64 instead of Apple][). I also had a porshe-pet back then (it was the for-runner of a C-64). Anyways apple did things in software that all of us new would be faster in hardware. But then magic happened... hardware changed... apple could adapt to totally new hardware... commodore couldn't (or couldn't easily AND take advantage of new features). If you were writing for commodore you have to rewrite whenever there was a hardware change, in some cases it was MAJOR work. Yet many programs that paid attention to the rules, would scale up on the Macs, and even use color when that came out. I had both a Mac and an Amiga.. and I figured it out. The future of computers was not hardware, it was the SOFTWARE. The hardware was groing so fast that the real issue is wether the SOFTWARE (OS) could keep up... if the software was a little slow now, wait two years and it'll be twice as fast. But if your hardware based it doesn't work that way.

The end result was my Amiga was a cool replacement for a nintendo... had many bitchen video-modes, spiffy souped up hardware... and even had a few decent productivity tools. But my Mac was what I could do work on... I had dozens of great productivity packages, lots of innovative NEW things altogether. Programs like MORE, Photoshop, Illustrator, PageMaker, Hypercard, were all innovations (and created on/for Macintosh). While the only innovation on the Amiga (besides nifty games) was a hardware hack that allowed me to do spiffy video editing (and some gawdy effects).

Since I was working out of my home, and had both machines, I watched my workload. If I had something I needed to do... 98 times out of 100 I went to my Mac. It was better. (I didn't even have color on my Mac). It cost one hell of a lot more for it (the Mac)... but I was using it .'. it justified itself. When I wanted to hack around, or play games... the amiga was my target.

But alas... in the real world there are more users than hackers... and the Amiga has gone the way of the dodo bird and the apple][']s. I can buy better game machines than the amiga was... and better business machines than the amiga was. It was ALWAYS a bargain in price... but since getting work done was more of an issue for me than price, my amiga got sold off.

Let us all have a moment of silence for dead-end hardware locked architectures.....

: the Amiga / OS/2 method, but overall it works very well. I think some of

: what you are saying is wrong - especially that which I've pointed out.

: --
: Opinions expressed above do not necessarily represent the views of my employer in any way, shape or form.
:

Part of the problem is that both Amiga Users and Mac users are looking at this from a different perspective. Amiga Users like the responsiveness of the OS and the machine, and that responsiveness is arguably better than a MAC Even when working from a lesser aquipped Amiga (<68030). Amiga Users are looking for a very respsonsive feel to the computer, and this is something the MAC doesn't start giving the USER until one buys a VERY powerful MAC. Even then there are certain things that will still annoy an Amiga user. Such as: The inability to do something else while another program loads, or to do a download w/any term program and still be able to do something else. Yes there may be term programs that can download fine while Photoshop render s (Zterm, etc.) but not everyone likes Zterm. IMHO I haven't found a MAC terminal program that is anywhere near the functionality of an Amiga term p rogram (Term, Terminus)

The biggest thing is that there are not very many MAC programs that take advantage of the interrupts that the MAC OS allows. IN fact there are far to few for my uses. It's hard to find programs that work well together and don't take anothers cpu time lock stock and barrel.

Most of the MAC users here are telling the Amiga users that they can do downloads and format floppies and render and have ftp/telnet sessions open and play a mod all at the same time without a degradation in the important task (ones that need to stay constant: music, video, download) But the thing is, there is no way a IIfx can do that, not without choking on at least something. The Amiga would never choke on simple tasks like that, and on top of it, the Amiga could have (x) more downloads, (x) more formatting floppies, (x) hard-drive formats, (x) more renders, and as many sessions open as the user wants without loosing a whole lot of responsiveness. The MAC would degrade in no time flat. That is the main difference in the OS's.

I am not arguing that the MAC can not do a "few" simple tasks without screwing up but in it's current state the MAC can not outperform tht loosing responsiveness/performance but the MAC will start loosing at almost a geometric rate when the tasks start adding up.

: else I want. What exactly is it the Mac must do to pass your litmus
: test? Have you ever -used- a customized, modern Macintosh for any length
: of time?

Well, playing two or three anims (each maybe 320x240 and at least 8bit)
without a glitch - maybe from three seperate HD's, while playing
some decent music (not cd-rom). Why don't we throw in a decent game
(Simcity2000?) and print a 500K document, extracting a 5mb archive
(in ram) and while we're at it, another game (tex mapped if you will,
of course with some speed loss, but still very stable and firm)
and do some 24-bit painting and manipulation (wich I did this trough
my Emplant-card using Photoshop) and maybe run some kind of PC
emulation at the same time (I run the game Zaxxon)...

Kicking in the Mac emulation did slow down a few of the above tasks a
little but still usable for normal opperations...
This is by no means the limit for the Amiga to remain stable but
if a Mac is able to do anything similar I'm eating the dust.. :-)

Cheers....

> Well, playing two or three anims (each maybe 320x240 and at least 8bit)

Why not just go full screen, CINEPAK compression, 32k color 15 bit graphics, syncronized 16 bit sound, and ability to resize windows? Oh..the Amiga can't. Nevermind...

IFF7 is very fast, but I think you've got to look at what's being done - next to no compression (c'mon - DELTA compression? G's!), no syncronization with sound, no syncronization with the CPU's speed, no ability to resize windows, and only a limited ability to use "OLE" like functions with it (like placing IFF7 anims into documents, among other things. It's not an OS service like QT2.0 is.) There is also no device independence in output, so a 24 bit anim can't dither to a 15 bit anim without a -lot- of extra programming, something QT2.0 does all ON THE FLY.

> without a glitch - maybe from three seperate HD's, while playing

3 hard drives? One isn't enough? :)

> some decent music (not cd-rom). Why don't we throw in a decent game

This doesn't matter.

> (Simcity2000?) and print a 500K document, extracting a 5mb archive

SimCity 2000? Boy, can you say --SLOW-- on an Amiga? Dear God, if anything that was a -bad- game to bring up. For all of the Amiga's supposed speed, try, just -try-, running this on a hires interlaced screen in 8 bit color (deinterlaced on aga, naturally.) Slowwww....in fact, try running Workbench in 8 bit deinterlaced resolution. Dear GOD this thing gets slow in "hires" 640x480x8bits!

Printing? No problem.

> (in ram) and while we're at it, another game (tex mapped if you will,

No problem, but putting the dearchiver in the background will slow down, admittedly.

> of course with some speed loss, but still very stable and firm)
> and do some 24-bit painting and manipulation (wich I did this trough
> my Emplant-card using Photoshop) and maybe run some kind of PC

Ah, using real applications now, I see. :)

> emulation at the same time (I run the game Zaxxon)...

198...2? 1983? Load up SoftWindows. Hey, how's Emplant/PC working these days? :)

> This is by no means the limit for the Amiga to remain stable but
> if a Mac is able to do anything similar I'm eating the dust.. :-)

The Amiga can run old apps well. The question comes into being when you attempt to run modern 1994-style applications on it. Then, it starts fading fast, IMO.

5219. Apple announces Pippin platform

Newsgroup: comp.sys.atari.advocacy
Date: 1994-12-14 01:56:26 UTC
From: sinclair@ins.infonet.net
Message-ID: <3cljca$7kq@insosf1.infonet.net>
Source record: 14216

Apple Computer Announces New Pippin Multimedia CD-ROM Platform

First Pippin Licensee, Bandai Co., Ltd., To Introduce Multimedia Player For Families In Late 1995

CUPERTINO, California--December 13, 1994--Apple Computer announced today a new platform for multimedia players that aims to provide consumers with high performance and affordable CD-ROM-based systems for education and entertainment. The platform is called Pippin, and is derived from the Mac OS--the operating system for Macintosh personal computers---and the PowerPC microprocessor. Apple plans to openly license the platform to a variety of vendors from different industries.

"Pippin is yet another example of Apple's commitment to expand the availability of multimedia technologies to people around the world," stated Satjiv Chahil, vice president of Apple ComputerUs New Media Group. "Now multimedia technology has the potential of reaching the penetration levels of audio CD players and VCR's."

Apple believes that the Pippin platform will provide customers and software developers with significant advantages over current CD-ROM-based multimedia players, many of which are focused simply on playing expected to support a wide array of multimedia titles. Many existing Macintosh multimedia titles--from child and adult education, information reference, entertainment, games and music--are expected to run on Pippin-based systems, as developers will only need to make slight modifications to current Macintosh multimedia software to make them compatible with Pippin-based systems. This is expected to give consumers a much broader range of software titles than that offered by game-based CD-ROM players. Conveniently, CD-ROM titles developed specifically for Pippin can also be played, without modification, on a Macintosh computer. And just as important, it is expected to greatly expand the market for Macintosh multimedia developers. Macintosh already is the leading platform for multimedia software development in the world and the market leader in multimedia software sales in Japan.

Additionally, the company believes that PippinUs RISC-based architecture will promote the development of new and compelling multimedia software that takes advantage of the exceptional power of the PowerPC microprocessor.

As a result, Apple expects that Pippin will be the multimedia platform able to deliver easy-to-use family entertainment and education at a lower price than existing personal computer products, software programs than current game players.

"CyberFlix is excited that Apple is bringing an easy-to-use CD-ROM player to the mass market," said Bill Appleton, President of

CyberFlix, Inc. "We plan to support it with all our titles."
Concurrently, at a press conference today in Tokyo, Apple and Bandai Co., Ltd., one of the largest family entertainment companies in the world, announced that Bandai will be the first to license Pippin, with introduction of Bandai's multimedia player slated for late 1995. (See related press release Dec. 13, 1994 "Apple and Bandai to Develop CD-ROM Multimedia Player Based on Apple Pippin Platform").

PowerPC Performance For the Next Generation of Multimedia Players
Powered by the advanced PowerPC 603 microprocessor, Pippin will use a sub-set, or run-time version, of Apple's popular Macintosh operating system that allows users to run a given title. The performance of the RISC-based, 64-bit architecture of the PowerPC chip is expected to provide processing power for a new generation of interactive education and entertainment CD-ROM software programs.
"Prior to Pippin, moving software from the Mac to any of the set top systems required a huge development effort," stated Michael Kripalani, CEO of Presto Studios, Inc. "We are already engaged in Project which has been designed to take advantage of PippinUs PowerPC 603 processor and 4X ROM drive."
Apple Computer, Inc., a recognized pioneer and innovator in the information industry, creates powerful solutions based on easy to use personal computers, servers, peripherals, software, online services, and personal digital assistants. Headquartered in Cupertino, California, Apple (NASDAQ:AAPL) develops, manufactures, licenses and markets products, technologies and services for the business, education, consumer, scientific & engineering and government markets in over 140 countries.

Look, this is exactly what I try to avoid, such meaningless and
baseless speculation. Nobody knows. The potential though is unlimited.
Whether it can be exploited is the question, and I can't answer it yet.

Looks like VI ate some of that text above.

Let me restate it:

I am not arguing that the MAC can not do a "few" simple tasks without
screwing up but in it's current state the MAC can not outperform the Amiga
The MAC would start loosing responsiveness/performance at almost a
geometric rate when the tasks start adding up compared to the Amiga
which would degrade minimally.

Above restated a bit different but the original made no sense what
so ever. I hope this one does. :-)

BTW: This is IMHO.

We got the demo version of Marathon and I have to say that I'm not that impressed. Even on a 33mHz 040 Quadra 650 or a Powermac 7100/66 it doesn't come _remotely close_ to capturing the feel and adreneline of a good game of net Doom run on decent 486/66s.

I can appreciate it is technically better (higher res, more textures, more colours and more net players) but it doesn't really match it for speed or playability.

>new Falcon (still under development) will run Clab and/or Cubase Audio
> and sell for around $2000.

There is talk of a budget model to crack on to the original ST music
market to sell for around the 300 (UK) mark.

>Anyone heard of New Falcon developments/ specs?
>will there be a rackmount version?

There is to be a rack version with a plug in keyboard if what I hear
is true.

>Will it be able to run any PC software (albeit slowly)?

Why would it want to ? The timing inaccuracy in PC music software
make it a non-starter. Better to run the Mac versions instead.

Craig.

Apple will NEVER make it in the multimedia player (ie video game)
arena. They haven't got a name to play with and are up against real
muscle - NEC, SONY, 3d0, Nintendo, Sega & Atari are all up there
already - there just isn't room for a small company like apple, with
no prior roots in this area and without the resources of SONY to stomp
in and set up from scratch.

(I know Atari is a smaller company, but they have the name & they virtually
created the video game market in the first place - they're roots are
there...)

Craig.

: Oh..the Amiga can't. Nevermind...

Maybe, but I can play 640x512 262k CDXL with synch sound....
When playing anims, Ham8 is even better than 16-bit gfx...

: IFF7 is very fast, but I think you've got to look at what's being done -
: next to no compression (c'mon - DELTA compression? G's!), no
: syncronization with sound, no syncronization with the CPU's speed, no
: ability to resize windows, and only a limited ability to use "OLE" like
: functions with it (like placing IFF7 anims into documents, among other
: things. It's not an OS service like QT2.0 is.) There is also no device
: independence in output, so a 24 bit anim can't dither to a 15 bit anim
: without a -lot- of extra programming, something QT2.0 does all ON THE
: FLY.

: > without a glitch - maybe from three seperate HD's, while playing

: 3 hard drives? One isn't enough? :)

: > some decent music (not cd-rom). Why don't we throw in a decent game

: This doesn't matter.

: > (Simcity2000?) and print a 500K document, extracting a 5mb archive

: SimCity 2000? Boy, can you say --SLOW-- on an Amiga? Dear God, if
: anything that was a -bad- game to bring up. For all of the Amiga's
: supposed speed, try, just -try-, running this on a hires interlaced screen
: in 8 bit color (deinterlaced on aga, naturally.) Slowwww....in fact, try
: running Workbench in 8 bit deinterlaced resolution. Dear GOD this thing
: gets slow in "hires" 640x480x8bits!

Won't argue on this one. It is, however, quite playable even on aga..
And, what you're not aware of is that I'm able to force the Simcity
screen over to the gfx-card - now it runs smooth a silk...

:Printing? No problem.

> (in ram) and while we're at it, another game (tex mapped if you will,

: No problem, but putting the dearchiver in the background will slow down,
: admittedly.

And what about ram? My *imagined* test is based a 14mb system and
remeber, the Mac emulation sucks up 6-7mb alone...

: > of course with some speed loss, but still very stable and firm)
: > and do some 24-bit painting and manipulation (wich I did this trough
: > my Emplant-card using Photoshop) and maybe run some kind of PC

: Ah, using real applications now, I see. :)

Won't argue about this either...

: > emulation at the same time (I run the game Zaxxon)...

: 198...2? 1983? Load up SoftWindows. Hey, how's Emplant/PC working these
: days? :)

Eh yes, 1983 I think it was. This was just fot fun though.
Running Softwindows with any serious intentions in mind is going
to chew up at least another 10mb. If I remember, Insignia's
minimum requirements is 12mb for Windows alone. Add that to
my minimum of 16mb on the Mac side (open for reevaluation of course)
and you are looking at some serious bucks for the average and
rather serious Mac user...

: > This is by no means the limit for the Amiga to remain stable but
: > if a Mac is able to do anything similar I'm eating the dust.. :-)

: The Amiga can run old apps well. The question comes into being when you
: attempt to run modern 1994-style applications on it. Then, it starts
: fading fast, IMO.

What do you mean?
I'm sertainly, by any standards, using modern apps both on the
Mac, Pc and AMIGA.

Cheers....

5233. C-Lab, Falcon & Atari

Newsgroup: comp.sys.atari.advocacy
Date: 1994-12-14 22:12:33 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <3cnqkh$29o@dux.dundee.ac.uk>
Source record: 14231

The news that C-Lab have aquired 'rights' to make a clone of the Falcon
is indeed good news. It means that we will have more choice e.g
Atari or C-Lab, also the chance to get a wider range of Falcons, perhaps
C-Lab will ship both Low-end (consumer models) and high end work stations.

To be honest I doubt Atari will stop manufacturing the Falcon in the near
future, they are probably still making some money out of it so
why should they?

At last we'll have a choice of manufacturers when (if) we decide to
upgrade, in my book that isn't a bad thing. All that we need now is
the Falcon to come witha more grown up GUI, then we're really talking.

Ah, yet another person who mistakes the lack of 90 MPH running for a slower engine. Marathon limits you to moving about at semi-reasonable speeds; its run mode is somewhere around as fast as Doom's walk mode. That doesn't mean that its frame rate is worse, just that you don't get to move as fast through the scenery.

I also love the playability, both as a net game and a 1-person game. In 1-person mode, it actually forces you to do things like conserve ammo. Doom single-player is still just a shootout; Marathon single-player is a combination of shootout and strategy.

Uh - "small"? I wouldn't exactly call Apple small - they are one of the
largest personal computer companies in existence. Remove NEC, Sony, 3DO,
and Atari from the big-time list too - NEC's attempts to get into the
video game market flopped, Sony isn't there at all yet (i.e. same position
as Apple), 3DO isn't established as a truly major platform, and Atari
isn't either.

If you actually think Apple has less muscle than Atari, I'd like to know
what stock reports you were looking at.

This is obviously a very predatory move on Apple's part. Essentially
they're talking about a limited-function PowerMac as a set-top box. That
has a lot of potential.

: To be honest I doubt Atari will stop manufacturing the Falcon in the near
: future, they are probably still making some money out of it so
: why should they?

They announced that they will stop on January 1st 1995. The Atari
name will be taken off of the Falcon, though the case will remain the
same. The Falcon isn't making money for Atari ... I would argue that it's
been a money losing venture all along. If anything has a chance, it's the
Jaguar.

Have you heard of the Performa line of consumer macs? This line is doing very
well at consumer outlets. Most of the Performas are sold with cdroms
installed.

Wll Apparently the Atari name is not doing the Jagflop any good. The Atari
name is synomous(sp) to the Tramiel family.. Need I say more?

better than pathetic QT2.0.

: syncronization with sound, no syncronization with the CPU's speed, no
: ability to resize windows, and only a limited ability to use "OLE" like
: functions with it (like placing IFF7 anims into documents, among other
: things. It's not an OS service like QT2.0 is.) There is also no device
: independence in output, so a 24 bit anim can't dither to a 15 bit anim
: without a -lot- of extra programming, something QT2.0 does all ON THE
: FLY.
On the fly slowly that is.

I hope you don't think that QT2.0 is superior to the Amiga in anim
playback. The only two things it has going for it are: built in sound
support, and integration into applications. Believe me those are really
nice things to have but... The sound support is pretty pathetic, the
sychronization with sound sucks royally. Apple still hasn't gotten it to
work correctly yet. The Amiga has always been superior in the sound
sychronization arena. Hell if I play the same anim back on a MAC more than
once the sound and video don't match up every single time the same way. Now
that's pathetic. BTW: I was running this on a Centris 650 with 16mb and
a few apps loaded in the background. Which goes to say that either the
cooperation tasking is at fault, QT was at fault, or the MAC hardware can't
handle anims as well as the AMIGA. I'd say it was a little of both.

: > without a glitch - maybe from three seperate HD's, while playing

: 3 hard drives? One isn't enough? :)

No, more than one would be a good test on how well the computer could
interact with the SCSI bus and the hard-drives connected to it.

: > some decent music (not cd-rom). Why don't we throw in a decent game

: This doesn't matter.

Why not? It would only bog the MAC down even more if it were playing
music, is that why you don't want to play any?

: > (Simcity2000?) and print a 500K document, extracting a 5mb archive

: SimCity 2000? Boy, can you say --SLOW-- on an Amiga? Dear God, if
: anything that was a -bad- game to bring up. For all of the Amiga's
: supposed speed, try, just -try-, running this on a hires interlaced screen
: in 8 bit color (deinterlaced on aga, naturally.) Slowwww....in fact, try
: running Workbench in 8 bit deinterlaced resolution. Dear GOD this thing
: gets slow in "hires" 640x480x8bits!

: Printing? No problem.

Apples Print Managing program is very well done, I really haven't seen to
much of a performance hit when printing. It might slow a bit, but the
printing isn't exactly a CPU hog.

: > (in ram) and while we're at it, another game (tex mapped if you will,

: No problem, but putting the dearchiver in the background will slow down,
: admittedly.

The dearchiver would slow down on any machine if the machine were running
more than one CPU intensive task. Buy have you ever tried to compress
more than one thing at a time? Or how about uncompressing at the same time?
I have compressed (27) different directories all at the same time on the
same hard-drive, needless to say the hidrance there was he hard-drive
speed not the multi-tasking or the compression program.

: > of course with some speed loss, but still very stable and firm)
: > and do some 24-bit painting and manipulation (wich I did this trough
: > my Emplant-card using Photoshop) and maybe run some kind of PC

: Ah, using real applications now, I see. :)

I know this was a joke but define "REAL APPLICATIONS".

: > emulation at the same time (I run the game Zaxxon)...

: 198...2? 1983? Load up SoftWindows. Hey, how's Emplant/PC working these
: days? :)

Softwindows sucks compared to Emplant's MAC emulation. Softwindows
doesn't come anywhere near the same performance as Emplant does. Besides
there are other PC Emulators.

: > This is by no means the limit for the Amiga to remain stable but
: > if a Mac is able to do anything similar I'm eating the dust.. :-)

: The Amiga can run old apps well. The question comes into being when you
: attempt to run modern 1994-style applications on it. Then, it starts
: fading fast, IMO.

What modern Amiga programs are slow? There are many program on my machine
that are modern, and they don't slow down the machine half as much as
Apps. do on the MAC.

With 16 bit sound? At 30 fps? All generated by the Amiga, not the CDROM drive? All on a stock machine? Please, more information.

We'll agree to disagree on HAM8. For -anything- with rapid palette shifts, HAM8 is a disaster, and it's a heck of a lot slower than other modes when you take that and "high" resolution into the equation. I'd be impressed if you could pull that sort of information off the hard drive that fast, with the above 16 bit sound, with IFF32's compression. Tell me more about IFF32.

>IFF7 is very fast, but I think you've got to look at what's being done -

> Ever tried Scala MM300 - dithers fine, on the fly....

How much extra(for the creation module)? And if run-time players aren't free -and- easily available to everyone, what's the point? It's still not integrated into the OS like QT is. When QT is improved, ALL QT-using apps are automatically improved. That's the beauty of it. With IFF32/7, when a new scheme comes out, nothing takes advantage of it until the anims are decompressed and then rewritten in the new format, which is neither automatic nor trivial. Granted, it's easy, but the OS should do that for you.

The key point, though, is I'm asking why puny 8 bit screens at 640x480 or
slightly higher is so slow on a $2000 machine, the A4000/040.

> What you are not aware of (I didn't mention it, sorry) is that

> halt the Mac-side and chew up at least another 10mb of ram.

Granted, but it works, which is more than I can say for Emplant. Also, SW
2.0 should be significantly better.

> If I remeber, the *minimum* requirements proposed by Insignia
> for windows alone is 12mb. Add that to *my* requirements
> of 16mb for the Mac (open for reevaluation of course) and
> you are looking at some serious bucks for the average Mac user...

$200 in extra RAM? Hmm...well, I disagree. With RAM at $100 per 4M, it's
just not expensive anymore. Add that to the great price on PowerMacs

($1250 via Apple's discounts, although I haven't confirmed that yet) and for just $1500 or so you've got a 16M machine that's running a RISC PPC 601. That's far faster than an A4000/030 that you'd get at the same price, with 4M or so of RAM.

>The Amiga can run old apps well. The question comes into being when you

>
> Like what? "modern 1994-style applications", uh??
> I would say that my apps are sertainly modern by any standards....

Word processing, database, and spreadsheet apps all lag behind on the Amiga. Terminals are good, but most other connectivity features (newsreaders, WWW browsers, mail readers, etc) are all -seriously- behind the times or else nonexistant. Why does a market for Emplant exist at all? Because the Amiga lacks apps.

Darryl Still (Atari UK) said this morning that Atari are continuing to
manufacture Falcons, and have no current plans to drop production. C-Lab
have the right to continue production if/when Atari do eventually decide to
stop.

|> thinkable. Have a little character and admit that the Mac just is NOT a
|> strong gaming platform!

Generally not as strong as the Amiga, especially in the low-end but all kinds of input devices work with the Mac. I have a Gravis Mouse Stick for my Quadra 800 to do flight sims. Also, a number of decent pinball games exist for the Mac. Not every game on the Mac has the problems of Myst which by the way is slow because of the inherently slow media. As an aside, I cannot understand the big deal made over Myst. OTOH, there are a number of CD-ROM offerings on the Mac that are pretty neat like Peter Gabriel's Xplora. Anyway, most of the Amiga games are unplayable on my A3000 or A4000 without a lot of hassle and sometimes, not at all. Hell, I have to fire up my old A1000 to play most of the games I've bought for my Amigas. Your point of appropriate platforms for gaming only applies in the low-end and there the Amiga basically gets beat by the gaming only platforms. Unfortunately, I think that the CD32 has probably missed its window of opportunity. And the A600 was ill conceived at best. That leaves the A1200 which currently cannot be bought and costs a good bit with a hard drive. I hope that the Amiga survives the current state of affairs but I also believe it will be an uphill battle. And, slamming the Mac and PC will not help the fate of the Amiga. Finally, PowerMacs probably do not make good gaming platforms at this point and will probably not do so as long as emulation mode is required for a significant part of the OS and apps. You should try some Mac games on a low-end 68LC040 based Performa. Just a thought. Seems like a waste of a very expensive system to play games on a PowerMac.

I've had the impression that the C-Lab Falcon 2 will be "a music/audio
computer" and so it's not made for "normal" users - that's why Falcon
will stay in the market. Also, if they put in it what is rumoured, the
C-Lab Falcon will cost twice the Falcon's price (but then it will be
twice as good :-))

Umm.... do you have a clue? QT2.0 isn't a compression scheme, it is a set of routines (& an API for calling them) that deal with time-based data. Could be anything time based, not just video & audio. The compressor/decompressors (or codecs) are installable under QT 1.6.1 & above just by dragging the codec (in extension form) into the extension folder. For instance, I have the Microsoft codecs (so that I can play .avi files) and the Intel Indeo codec added to my system. The point: if you want to compare the compression of HAM vs. a QT codec, you have to name the specific codec & the parameters used (video quality setting, if it was data-rate limited, etc.)

Re: What about Atari?

BTW, just in case anyone is interested:

The German company Application Systems Heidelberg, which previously excelled in producing and distributing Atari ST Software (Signum 3 is their top title) now has released an Atari Emulator for the Apple Macintosh called MagiCMac.
With it you can use almost any Atari Software. The performance on the higher end Macintosh Systems is said to be far beyond the latest Atari System. There are certain restrictions due to the different interface ports (the Macintosh lacks a Centronics parallel interface).
The music industry, where Atari holds a strong market share, have already expressed their enthusiasm about this product. It will enable them to use the best of both worlds in multimedia software.
A native Power Macintosh Version, which will enable Atari developers to develop applications using PowerPC code is currently under investigation, sources say.
The product enables users to run Atari and Macintosh Software concurrently.
The price in Germany is about $150 (excl. Sales Tax) at current exchange rates.

Sorry, I don't know about US sources for the product. On request I will ask ASH about US distribution and post it to the net.

Cheers,

Oliver.

So Apple is going to compere against the likes
of SEGA, Nintendo and SONY?

Ha ha ha.. how much is a Pippin machine?
The Sony Playstation blows away any performance you can
take out of a Power PC 603 based OS-Mac graphical wise.
It simply fucking destroys it.

: > Umm.... HAM? That's pretty damn good compression if I must say so. Much
: > better than pathetic QT2.0.

: Umm.... do you have a clue? QT2.0 isn't a compression scheme, it is a set
: of routines (& an API for calling them) that deal with time-based data.
: Could be anything time based, not just video & audio. The
: compressor/decompressors (or codecs) are installable under QT 1.6.1 &
: above just by dragging the codec (in extension form) into the extension
: folder. For instance, I have the Microsoft codecs (so that I can play
: .avi files) and the Intel Indeo codec added to my system. The point: if
: you want to compare the compression of HAM vs. a QT codec, you have to
: name the specific codec & the parameters used (video quality setting, if
: it was data-rate limited, etc.)

I have some clue, at least I thought I did. :-)

Anyway I was under the impression that QT uses some sort of jpeg type
compression if it wanted. If I am wrong well, shit happens.

Besides the thing still remains that HAM8 anims on an Amiga4000 are still
superior to a MAC with QT2.0. It still doesn't change the fact that QT
uses a frame dropping technique in order to try and keep up with the
sound. IMHO this is pathetic and inexcusable. QT2.0 isn't the best
thing and isn't anywhere near as awesome as a HAM8 anim and 8bit sound or
16bit sound with a AD516.

I do know something about Mac's. I still think that QT uses some sort of
compression. What type is it? Or can it use any type you want?

Fill me in if you know the answers.

Well raist, it's a wait and see. The pippin will most likely be marketed in Apple's traditional markets that the consoles do not exist like the education market. Apple has the marketing and distribution as well as the software base to make it a sucess, onlt time will tell though..

5256. 1994 Jaguar Letter Writing Campaign (repost)

Newsgroup: comp.sys.atari.advocacy
Date: 1994-12-16 04:02:37 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <3cr3gu$g2s@usenet.INS.CWRU.Edu>
Source record: 14157
Cross-posted to: rec.games.video.atari,rec.games.video.misc,comp.sys.atari.st,comp.sys.atari.advocacy,alt.games.lynx

I'm reposting this again because it is important for everyone to write these companies this month. I have posted it today for you to print out and then do some writing this weekend (with those extra .29 cent stamps you have left over from Christmas cards!).

And remember, this is the best time to write. Stamps only cost .29 cents. Find those left over stamps and write!

I will not post this the week of Christmas so please copy this text now!!!

-------- begin text --------

END OF THE YEAR Jaguar Letter Writing Campaign

Organized by: Len Stys

E-mail: aa399@cleveland.freenet.edu

Hey Jaguar players!

In September, I spent several hours getting names, addresses, and information related to these well-known game software companies for you. I did this because I felt it was real important for everyone to write these companies and let them know that we want their games for the Jaguar. Since September, I have been posting four or five of these companies each month to the Internet and various systems to get the word out about this campaign.

If you haven't written them because you didn't have time, this is your last chance this year to write them.

It is extremely important for these companies to start developing for the Jaguar now. This is because December is really the last month that developers can start developing for the Jaguar and have their game out for it by Christmas of next year. It takes approximately nine months to develop and manufacture a real great Jaguar game. And add another couple of months if the programmers need to get familiar with the unit.

If you are worried that Sony, Nintendo, and Sega are going to come along late next year with a $70 million advertising budget to spoil the Jaguar's fun--you should be worried! Because that is what the companies are planning to do. (Let's not forget about 3DO and Apple Computer!)

Right now, Sony, Nintendo, and Sega are attempting to convince these very companies listed in this text-file to develop for their next generation system. Atari Corp. is probably doing the same thing. But Sony, Nintendo, and Sega are bigger players than Atari right now. This is why we need to help Atari

out a little bit by letting these companies know that we want their games for the Jaguar.

I cannot urge you enough to write these companies. You (even though you may not realize it) play a big part in if the Jaguar succeeds or fails. Just by -one- letter to each of these companies could determine Jaguar's fate. Your one letter can also make sure your investment in purchasing the Jaguar and several Jaguar games was a wise one.

Christmas time is about GIVING to others. Why not give Jaguar a chance in 1995? Write these companies.

id Software
WMS Industries Inc.
Capcom USA Inc.
Electronic Arts Inc.

>>>>>>>>>>>>>>>>>>>>>>>>> id Software <<<<<<<<<<<<<<<<<<<<<<<<<

The letter to id Software should thank the company for producing Wolfenstein 3-D and DOOM for the Jaguar and encourage the company to make QUAKE for the Jaguar.

id Software's e-mailing address:

Jay Wilbur, CEO
id Software
Town East Tower
18601 LBJ Freeway
Suite 615
Mesquite, Texas 75150

The following is a list of things which you may want to say in your letter to id Software:

Dear Mr. Wilbur,

1) How much you enjoy Jaguar Wolfenstein 3-D and/or DOOM.
2) How much you like id Software.
3) Thanks for making Wolfenstein 3-D and DOOM for the Jaguar.
4) How you are excited about id Software making games for the Jaguar.
5) How you would like to see QUAKE made for the Jaguar.
6) Thank you to Mr. Wilbur for reading your letter.

Another thing which you may want to include in this letter is concerning Jaguar DOOM II. It is possible for id Software to release DOOM II for Jaguar next year. If you would like to see DOOM II for the Jaguar, encourage the company to make it. But if you do encourage them to make it, ask that it support modem and at least four players networked. Also, ask for the company to place DOOM II on cartridge so that public domain maps can be released on CD for Jaguar's CD-ROM player. This will make sure that DOOM II -never- gets boring on the Jaguar and multi-playing is always exciting.

>>>>>>>>>>>>>>>>>>>>>> WMS Industries Inc. <<<<<<<<<<<<<<<<<<<<<<

As of December 1, 1994, Mortal Kombat II has not been announced for the Jaguar. And Acclaim has no plans to produce Mortal Kombat for the Jaguar. But next year, WMS Industries will be able to release Mortal Kombat II for any game system that the company wishes to release it for. The time is now to let WMS Industries know that we want to see Mortal Kombat II and Mortal Kombat III for the Jaguar.

Mortal Kombat II is by far the #1 most wanted game for the Jaguar according to the Most Wanted Games for the Jaguar list by CAIN Newsletter. If this game is released for the Jaguar, the Jaguar will be the most wanted game system.

The mailing address of WMS Industries Inc. is:

Louis J. Nicastro, CEO
WMS Industries Inc.
3401 North California Ave.
Chicago, IL 60618-5889

OK. I don't think I have to remind you that you should write as neat and as professional as possible to get the best results. If you certify your letter, you may even reach the president with your letter.

The following is a list of things in which you may want to say in your letter to WMS Industries Inc.:

Dear Mr. Nicastro,

1) How much you enjoy Mortal Kombat II
2) How you like the games that WMS Industries makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get the game for the Jaguar as soon as it is released.
6) How you would also like to see Jaguar be the first system to get Mortal Kombat III.
7) Thank you to Mr. Nicastro for reading your letter and for considering making Moral Kombat II for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>> Capcom USA INC. <<<<<<<<<<<<<<<<<<<<<<

Capcom is known for producing the Street Fighter II series of games. The company is also known for producing games such as The Great Circus Mystery Starring Mickey & Minnie Mouse, Demon's Crest, and Saturday Night Slam Masters. The company also does conversions of popular titles such as Wizardry V and Eye of the Beholder.

Super Street Fighter II Turbo is second only to Mortal Kombat II on the most wanted games for the Jaguar CAIN Newsletter listing. If the game existed for the Jaguar, it would no doubt sell a lot of Jaguars. But

Capcom is not making Super Street Fighter for the Jaguar and no plans have been announced to do so in the near future.

The strange thing is that Capcom is making Super Street Fighter II Turbo for the 3DO platform. The game will even have better graphics than that on the SNES and Genesis. But this only means that if Capcom will make a version of SSFIIT for a much higher-priced system than there is a chance that the company will be willing to make a Jaguar version.

The mailing address for Capcom USA Inc. is:

Scott Smith
Product-Development Coordinator
Capcom USA Inc.
475 Oakmead Parkway
Sunnyvale, CA 94086

The following is a list of things in which you may want to say in your letter to Capcom USA Inc.:

Mr. Smith,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get Super Street Fighter II Turbo for the Jaguar as soon as it is released.
6) Thank you to Mr. Smith for reading your letter and for considering making Super Street Fighter II Turbo for the Jaguar.

You may also want to FAX Capcom USA by the phone number: 408/774-3995. But sending mail through the U.S. Postal Service may prove to be more successful.

>>>>>>>>>>>>>>>>>>>> Electronic Arts Inc. <<<<<<<<<<<<<<<<<<<<<<

Electronic Arts is the publisher of some incredible games such as: NBA Showdown, FIFA International Soccer, PGA European Tour Golf, NHL Hockey '94, Wing Commander, Super Wing Commander, John Madden NFL Football, Escape from Monster Manner, Twisted, Mario Andretti Racing, MLBPA Baseball, and many more! Electronic Arts also owns several other software companies that they may give the OK to develop the Jaguar for if they see there is a demand for Jaguar games.

Unfortunately, Electronic Arts is also a major backer of 3DO, a company that is a big competitor of Atari Corp. Electronic Arts is spending a lot of time and money on making games for 3DO that it could be spending on the Jaguar.

There is hope though! Electronic Arts is a licensee. This means that the company has Jaguar developers units. Electronic Arts' management

just has to give the OK to make games for the Jaguar.

The mailing address for Electronic Arts Inc. is:

Lawrence F. Probst III, President
Electronic Arts Inc.
1450 Fashion Isle. Blv.
San Mateo, CA 94404

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Probst,

1) How much you enjoy Electronic Arts games.
2) How you have been buying Electronic Arts games for your computers since the company was started (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) The games that you would love to slee on the Jaguar (choose two or three Electronic Arts games--I'm choosing John Madden NFL Football!).
6) How you believe Electronic Arts games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Electronic Arts' games when they are produced for the Jaguar.
8) Thank you to Mr. Probst for reading your letter and a thank you for considering producing games for the Jaguar.

Sierra On-Line Inc.
Dynamix Inc.
LucasArts Entertainment Co.
NovaLogic

>>>>>>>>>>>>>>>>>>>>>>>> Sierra On-Line Inc. <<<<<<<<<<<<<<<<<<<<<<<<

Sierra On-Line is a company that is well-known for their role-playing games such as their Space Quest and Police Quest series. The company is also known for their latest hits in the PC world: Gabriel Knight, Aces Over Europe, and Leisure Suit Larry VI. Sierra On-Line is planning to release their new title, Phantasmagoria, very soon.

Sierra On-Line is definitely a company that needs to be developing for the Jaguar if the Jaguar CD-ROM is to become used. If Sierra On-Line starts making games for the Jaguar CD-ROM, several other companies will make games for it as well.

The mailing address for Sierra On-Line is:

Kenneth A. Williams, President
Sierra On-Line Inc.
P.O. Box 485
Coarsegold, CA 93614

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Williams,

1) How much you enjoy Sierra On-Line games.
2) How you have been buying Sierra On-Line games for your computer since the company started making computer games (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see Sierra On-Line producing several Jaguar CD-ROM games.
6) The games you would love to see on the Jaguar (choose two or three Sierra On-Line games).
7) How you believe Sierra On-Line games would be fantastic on the Atari Jaguar.
8) How you will run out and buy Sierra On-Line games when they are made for the Jaguar.
9) Thank you to Mr. Williams for reading your letter and for considering producing games for the Jaguar.

In my letter, I will also be encouraging Mr. Williams to make games which have the option of using a keyboard with the Jaguar. A keyboard can be created for the Jaguar and Sierra On-Line could work with Atari Corp. to produce one for it. The use of a keyboard in role-playing games help children learn words. This is something that Sierra has gotten away from in PC games.

I'm also writing Sierra to release HOYLE Card Games for the Jaguar. I love this game and it would be great to see a modem feature being used in the Jaguar version of this game.

>>>>>>>>>>>>>>>>>>>>>>>>> Dynamix Inc. <<<<<<<<<<<<<<<<<<<<<<<<<

Dynamix Inc. is a game company owned by Sierra On-Line. This game company makes many wonderful titles for the PC such as: Betrayal at Kronder, Aces of the Pacific, and Front Page Sports Football Pro. The company is planning to release: Front Page Baseball, Battledrome, LodeRunner: A Legend, MetalTech: Earth Siege, Alien Legacy, and an excellent reviewed game called Aces of the Deep (submarine game).

Dynamix Inc. is making some real great games and these games would be a very good addition to the present Jaguar game library.

The mailing address for Dynamix Inc. is:

Alan Higginson
Executive Vice-President
Dynamix Inc.
P.O. Box 978
Oakhurst, CA 93644-0978

The following is a list of things in which you may want to say in your letter to Dynamix Inc.:

Dear Mr. Higginson,

1) How you enjoy Dynamix games on the PC.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or three Dynamix games--I'm choosing Front Page Sports Football, Alien Legacy, and Aces of the Deep).
5) How you believe Dynamix games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Dynamix games when they are produced for the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>> LucasArts Entertainment Co. <<<<<<<<<<<<<<<<<<<

LucasArts is famous for making games based on popular movies. The company has also has several popular titles out for the PC. Some of these titles are: Star Wars Rebel Assault, X-Wing, Indiana Jones and the Fate of Atlantis, Monkey Island 2: Le chuck's Revenge, and Day of the Tentacle. And if there is any truth to the rumor of a new Indiana Jones movie, LucasArts will probably make a great game based on this movie.

The mailing address for LucasArts is:

LucasArts Entertainment Co.
LucasArts Games Division
P.O. Box 10307
San Rafael, CA 94912

The following is a list of things in which you may want to say in your letter to LucasArts:

Dear Sir or Madam,

1) How much you enjoy LucasArts games.
2) How much you enjoy the Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games you would love to see on the Jaguar (choose two or three LucasArts games).
5) How you believe LucasArts games would be fantastic on the Atari Jaguar.
6) How you will run out and buy LucasArts games when they are made for the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX LucasArts by the phone number: 415/721-3344.

>>>>>>>>>>>>>>>>>>>>>>>>>>>> NovaLogic <<<<<<<<<<<<<<<<<<<<<<<<<<<<

NovaLogic is known for its high-quality games on the PC. The president and CEO, John Garcia makes sure each game title released is of the highest quality. NovaLogic is known for producing Comanche: Maximum Overkill (a game title that rated high on the Most Wanted Games for the Jaguar listing from CAIN Newsletter). The company also produced WolfPack (a submarine simulator) and UltraBots. The latest and greatest game from NovaLogic is Armored Fist. This game is highly praised by reviewers that have seen it.

John Garcia is interested in producing modem games and networking games in the future. NovaLogic's games would be a great addition to the Jaguar game library.

The mailing address for NovaLogic is:

John Garcia, President
NovaLogic
19510 Ventura Blvd.
Suite 200
Tarzana, CA 91356

The following is a list of things in which you may want to say in your letter to NovaLogic:

Dear Mr. Garcia,

1) How much you enjoy NovaLogic games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple of NovaLogic games).
5) How you believe that NovaLogic games will be even more fantastic when using the graphics and sound capabilities of the Jaguar.
6) How you would like to see NovaLogic games that use the Jaguar voice-modem and networking capabilities.
7) How you will run out and buy NovaLogic games when they are produced for the Jaguar.
8) Thank Mr. Garcia for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX NovaLogic by the phone number: 818/774-0684. Please consider writing NovaLogic through the U.S. mail first and then FAX NovaLogic.

Virgin Games
Spectrum Holobyte
Psygnosis
Origin Systems

>>>>>>>>>>>>>>>>>>>>>>>>>> Virgin Games <<<<<<<<<<<<<<<<<<<<<<<<<<

Virgin Games is already a Jaguar developer, so this letter is mainly to thank the company and to encourage them to make more titles for the Jaguar. Virgin is suppose to be making Cannon Fodder, Demolition Man, and Dragon for the Jaguar. The company is also planning to make a CD-ROM game called Creature Shock for the Jaguar.

Virgin Games is known for making a popular PC CD-ROM game called: The 7th Guest. It has also made Land of Lore, Dune II, and Indy Car Racing. It will also be releasing 11th Hour and Command & Conquer for the PC soon.

The mailing address for Virgin Games is:

Virgin Games
18061 Fitch Avenue
Irvine, CA 92714

The following is a list of things in which you may want to say in your letter to Virgin Games:

Dear Sir or Madam,

1) How you enjoy Virgin Games' games.
2) How much you enjoy the Atari Jaguar.
3) How you are really happy that Virgin Games is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games such as The 7th Guest (and name a few) besides the ones the company is already making for the Jaguar.
6) How you would like to see the Jaguar modem and network features used in Virgin Games' software (OPTIONAL).
7) How you will run out and buy Virgin Games' games when they are produced for the Jaguar.
8) Thank you to the person for reading your letter and for producing games for the Jaguar.

You may also want to FAX Virgin Games by the phone number: 714/833-8717.

>>>>>>>>>>>>>>>>>>>>>>> Spectrum Holobyte <<<<<<<<<<<<<<<<<<<<<<<

Spectrum Holobyte is famous for their Falcon flight simulator game. The game can even be played through the modem on PCs. Spectrum Holobyte has just released Fields of Glory and is rumored to be working on Falcon 4.0.

Modem games is something that a game system must have if it will be successful in the future. And Spectrum Holobyte is well-known for their modem games. Falcon 4.0 sounds like it would be perfect for the Jaguar.

The mailing address for Spectrum Holobyte is:

Barry J. Folsom, President
Spectrum Holobyte
2490 Mariners Square Loop
Alameda, CA 94501

The following is a list of things in which you may want to say in your letter to Spectrum Holobyte:

Dear Mr. Folsom,

1) How much you enjoy Spectrum Holobyte games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) How you would like to see Falcon 4.0 with voice-modem and networking capabilities on the Jaguar.
5) How you would like to see Fields of Glory and other Spectrum Holobyte games for the Jaguar.
6) How you believe Spectrum Holobyte games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Spectrum Holobyte games when they are produced for the Jaguar.
8) Thank Mr. Folsom for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX Spectrum Holobyte by the phone number: 510/522-2138. But please keep in mind that sending a letter through the U.S. Postal Service may be more effective.

>>>>>>>>>>>>>>>>>>>>>>>>> Psygnosis <<<<<<<<<<<<<<<<<<<<<<<<<

Psygnosis is a well known producer of video games. A few of Psygnosis' popular games are Microcosm, Shadow of the Best II, and Puggsy. A recent game is Hexx: Heresy of the Wizard. TThe company has also done Lemmings.

The mailing address for Psygnosis is:

Psygnosis
675 Massachusetts Ave.
Cambridge, MA 02139

The following is a list of things in which you may want to say in your letter to Psygnosis:

Dear Sir or Madam,

1) How much you enjoy Psygnosis games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple of Pysgnosis games).

5) How you believe Psygnosis games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Psygnosis games when they are produced for the Jaguar.
7) Thank the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX Psygnosis by the phone number: 617/497-6759.

>>>>>>>>>>>>>>>>>>>>>>>>>> Origin Systems <<<<<<<<<<<<<<<<<<<<<<<<<

Origin Systems is a maker of many popular PC role-playing and action games. The company is owned by Electronic Arts but may have freedom to develop for any system it wishes. Some of the games that Origin makes are: Ultima series (most recently Ultima VIII: Pagan), Wing Commander Privateer, and just recently Pacific Strike. Origin will be also making Biforge and Wings of Glory.

Since Origin Systems is a subsidary of Electronic Arts, there is no specific person to write.

The mailing address for Origin Systems is:

Origin Systems
Attn: Production Teams
P.O. Box 161750
Austin, TX 78716

The following is a list of things in which you may want to say in your letter to Origin Systems:

Dear Sir or Madam,

1) How much you enjoy Origin Systems games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or three Origin Systems games).
5) How you wish the Origin Systems Production Teams will attempt to get these great games on the Jaguar.
6) How unbelievable Origin Systems games will be when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Origin Systems games when they are produced for the Jaguar.
8) A thank you to the person reading for reading your letter and for considering producing games for the Jaguar.

QQP, Inc.
Broderbund
Konami
MicroProse

>>>>>>>>>>>>>>>>>>>>>>>>>>>> QQP, Inc <<<<<<<<<<<<<<<<<<<<<<<<<<<<

Many people are not familiar with QQP, but the company has released some pretty amazing games for the PC. Some of the games are: Solitaire's Journey, Merchant Prince, The Perfect General, Conquered Kingdoms, and their most recent--Origamo.

Most of the games that QQP makes either has to do with strategy or war. Strategy games are always popular, but war games have been restricted to PCs due to lack of a "save game" feature on video game systems. Jaguar can save games on its cartridges so this is no longer a problem in getting war games to home video game systems.

The mailing address for QQP, Inc. is:

QQP, Inc.
495 Highway 202
Flemington, NJ 08822

The following is a list of things in which you may want to say in your letter to QQP:

Dear Sir or Madam,

1) How much you enjoy strategy games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you love to see on the Jaguar (choose two or three QQP games).
5) How you would like to see these games make use of Jaguar's voice-modem and networking capabilities.
6) How you believe QQP games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy QQP games when they are produced for the Jaguar.
8) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>> Broderbund Software Inc. <<<<<<<<<<<<<<<<<<<<

Broderbund Software is well-known for producing two games. The first game is a CD-ROM game called Myst. The second is the Carmen Sandiego series of games. The Carmen Sandiego is educational.

The mailing address for Broderbund Software Inc. is:

Edmund R. Auer, President
Broderbund Software Inc.
500 Redwood Blvd.
Novato, CA 94948-6121

The following is a list of things in which you may want to say in your letter to Broderbund:

Dear Mr. Auer,

1) How much you enjoy Broderbund Software's games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) How you would love to see Myst, Carmen Sandiego, and any other new Broderbund titles on the Jaguar.
5) How unbelievable Broderbund Software games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Broderbund Software's games when they are produced for the Jaguar.
7) A thank you to Mr. Auer for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>>>>> Konami Inc. <<<<<<<<<<<<<<<<<<<<<<<<<<<

Konami makes several popular games. Among these are Double Dribble: The Playoff Edition, Lethal Enforcers 2, Batman the Animated Series, and a new game called Contra 4. The company has also made Rocket Knight Adventures, Teenage Mutant Ninja Turtles Tournament Fighters, Blades of Steel, Track & Field II, Top Gun: The Second Mission, and many others. Konami is also rumored to be developing Gradius for Sony's new PSX. Since Konami is already developing for other next generation systems, it may be more difficult to convince them to make games for the Jaguar. But Konami certainly does bring a lot of titles to a game system.

The mailing address of Konami is:

Konami Inc.
900 Deerfield Parkway
Buffalo Grove, IL 60089-4510

The folowing is a list of things in which you may want to say in your letter to Konami:

Dear Sir or Madam,

1) How much you enjoy Konami games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a few Konami games).
5) How unbelievable Konami games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Konami games when they are produced for the Jaguar.
7) A thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>> MicroProse Inc. <<<<<<<<<<<<<<<<<<<<<<<<

MicroProse is already developing Jaguar games so this letter will be mainly to thank MicroProse and encourage the company to make more of their games for the Jaguar. MicroProse is supposedly making Grand Prix, Gunship 2000, and possibly Star Trek: The Next Generation game. But MicroProse has made a lot of fantastic games for the PC that should really be made for the Jaguar. These include: World Circuit, Fleet Defender, Master of Orion, and Civilization. Civilization has already been made for the Falcon030 so it may not be too hard to convert the game to the Jaguar. Since Jaguar can save games on cartridge, it may be possible to make Civilization on the Jaguar. MicroProse is also making Across the Rhine, Colonization, and Masters of Magic.

MicroProse is indeed a very good company to have making Jaguar games. The quality has always been good and it would be nice for the company to make a lot of their games for the Jaguar.

The mailing address for MicroProse is:

Ronald J. Bueche, CEO
MicroProse Inc.
180 Lakefront Dr.
Hunt Valley, MD 21030-2245

The following is a list of things in which you may want to say in your letter to MicroProse:

Dear Mr. Bueche,

1) How much you enjoy MicroProse games.
2) How much you enjoy your Atari Jaguar.
3) How you are really glad that MicroProse is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games besides Gunship 2000 and Grand Prix be made for the Jaguar (name a few of your favorite MicroProse games).
6) How you would like to see the Jaguar voice modem and network capabilities used in MicroProse games. (OPTIONAL)
7) How you will run out and buy MicroProse games when they are produced for the Jaguar.
8) Thank you to Mr. Bueche for reading your letter and for making games for the Jaguar.

You may also want to FAX MicroProse at the phone number: 410/771-1174. But only FAX MicroProse if you do not have time to mail the letter or if you have already sent mail to the company.

****
* *
********** LETTER WRITING CAMPAIGN FINISHED **********

* *
****

After you have done writing all of these companies, the letter writing campaign will be finished. If you have written all of these companies, the campaign will no doubt be successful and we will be seeing the games we want for the Jaguar very soon.

Please spread the word around about this letter writing campaign on online systems, BBSs, message areas, user groups, and any other place that you can help get the word out abuot this campaign.

Also, please tell your friends! It is very important to get everyone participating in this letter writing campaign!

********** THANK YOU! **********

Gee, that couldn't possibly be because SoftWindows has to emulate a
different CPU, while Emplant runs on the same CPU that the Mac does?

If you want to do such comparisons, compare the PowerMac 68LC040 emulator
to SoftWindows (on a PowerMac).

When I see an intelligent, well-informed post such as yours, I almost
always press the right-arrow to chase down the flame tree. Funny,
there never is anything. Either the advocates see the non-flammable
truth, or they simply don't have enough information to respond.

By the way, what is the current status of A/UX? Once, it could have
persuaded me into becoming a Mac user. Even now, if I could get it for
about $100 or less (WITH Xwindow, of course), I'd get a Mac to use as
an A/UX workstation. The current price-tag is ridiculous - even the
horribly overpriced NextStep is cheaper!

Would there be any point to a PPC port of A/UX, especially since AIX
is there already? Will the Power Macs run AIX (how soon? how cheap?)
AIX would be the only compelling reason for me to consider a Power Mac.
It's availability would also put an end to "Mac Sux" postings on the net,
the same way Linux places PC boxes beyond reproach.

Ah, an Amiga zealot. As soon as you can get even the -basic- WinWord 6.x
running, let me know. Until that time, please, we're trying to deal here
with products that -really- exist and -really- work. JDrew's emulations
are slow and expensive to get working, even for ones that use the same
hardware, and he's got nothing close to a finished product in the PC
emulator.

You aren't seriously one of the ones that thinks you can get Pentium
speeds out of a stock A4000/040, are you? Jim really does have people
like that. Then he's got the more intelligent people (Nico Francois, of
PowerPacker and Scala fame, comes to mind) who are more than happy to tell
him he's full of it in his daily bundle of lies he posts.

Last I checked, codec (at least as far as it pretains to computerese,
and video/audio) was something like uhh COmpression-DECompression. So,
it is a form of compression- utilizing a form of standardized algorithm.

Granted, if you looked up codec in the dictionary, you might get some
definition as pretains to a "standard" codec=standard... I guess the IFF, and
datatypes of OS3+ aren't "standard", and thus don't = codec ;-)

I think your analysis is completely biased and WRONG, moreover.

Look, obviously you NEVER tried programming an Amiga at the OS level.
It's true that Commodore's marketing was poor, and that they don't know
how to support a machine, but the Amiga OS is GREAT.
In my opinion, you don't seem to look behind the apparence, like you're
mixing up Graphical Interface looks and Operating Systems... the Mac may
look great, but its OS is definitely not more advanced than the Amiga's.

Complete misinformation. You noticed the effects and mistook the cause
altogether. The basic problem is that the amiga was most often perceived
as a `game-only machine', and that people only started developping for the
base system (A500...), not even bothering to read the software manuals---when

they knew about its existence anyways.

Actually, the OS of the amiga changed LESS in ten years of existence than the Mac's did... the main problem was all the hw-compatibility hacks that they had to put in between 1.3 and 2.04 for the coders that never followed the rules (microsoft basic, for instance, was broken when Amiga went to 32bit addressing. In the Mac World, they had to rewrite part of the OS to go to full pointers...)

Still, Mean18 is running on my A3000 under OS 3.1 without a hitch... consider it also ran on an amiga1000 under OS1.1 some seven years ago.

The main difference is the market: people on the Mac HAD to adapt to new os's... as a clueless end-user, you never did notice the difference.
some software limitations of the mac:
no multitasking, then kludgy cooperative multitasking... under 7.0, one program's memory allocation is still static. I don't know if the stack limitation to 32K is finally gone however.

>
>The end result was my Amiga was a cool replacement for a nintendo...

>games) was a hardware hack that allowed me to do spiffy video editing
>(and some gawdy effects).

Video Toaster ? Lightwave ?
AmigaRexx ? Deluxe Paint ? ImageFX ?
Real3D ? DirectoryOpus ?

some of these tools I still haven't seen the equivalent on any other machine. Granted the amiga is a SMALL market... that's the problem, not some nonsense about some hardware compatibility problem.
The Mac market is a hell of a lot larger, and thus it responds a lot quicker. You just CAN'T compare the amount of money that gets poured into the developpement of new software of both machines. Once again, the hardware has NOTHING to do with that.

Sorry, but look at all the graphic cards that exist for the amiga, this is NOT
a hw-locked machine. The current system DOES support anything as far as
video goes. Commodore didn't manage to migrate to RISC-CPUs because it costs
money: you still have to rewrite most of the critical parts of the OS in
assembly-language, and you want a 68000-emulation mode at first... things
that powerMacs DO have and which is PERFECTLY feasible on the amiga...
just costs money !

OK, how much data do you generate in a week at home? Assume your applications and OS are archived on the original disks and don't need backing up. The vast majority of home users can back everything up onto one diskette per week..does it really matter whether you can format that diskette in the background? My post was just a plea to add some real world relevancy to the topics you discuss.

> >networked, file sharing/transfer is all done over the network (as are SW

I'll maintain that the home market is small compared to the business market. I'll maintain that mainstream decisions are based on the business market, not the home market. More and more business software is being delivered on CD.

My main point was that how or how fast a system formats a floppy is totally irrelevant, since floppy use is not a crtical issue. Talk about hardware and OS stability, talk about hardware integrity and upgradeability, talk about ease of integration into a multiplaform environment..these are important isuues..floppies aren't.

Peace.

Why does it have to work with _any_ terminal program? I'm sure one could
dig up an amiga terminal program that has problems running in the background.
That's hardly a damning criticism of the amiga.

>advantage of the interrupts that the MAC OS allows. IN fact there are far
>to few for my uses. It's hard to find programs that work well together and
>don't take anothers cpu time lock stock and barrel.

This simply isn't true; I run Microsoft Word, MacDraw Pro, Eudora,
and several other applications at the same time. Obivously none of them
are taking each other's CPU time "lock, stock and barrel".

Wait a minute I posted the above, BECAUSE the previous poster was
comparing the two. In my mind it was a stupid thing to do. I know that
the Emplant Emulation is faster because it's on the same chip as the 68k
MACs. The previous poster equated Softwinodws with Emplant MAC, which was a
retarded thing to do.

And why would I want to compare the (2) different MAC emulations? That's
another silly thing. I advocate for the Amiga when possible.

: That's hardly a damning criticism of the amiga.

Find one for me then, and make sure it was written for at least AmigaOS 2.0.
I don't think you can, and believe me I've looked at every single TERM
program I could find, and haven't run into one that couldn't multi-task.

I am surprised you didn't say anything about my attack on Mac terminal
programs. That makes me believe that you think Mac term programs lack
functions also.

: >advantage of the interrupts that the MAC OS allows. IN fact there are far
: >to few for my uses. It's hard to find programs that work well together and
: >don't take anothers cpu time lock stock and barrel.

: This simply isn't true; I run Microsoft Word, MacDraw Pro, Eudora,
: and several other applications at the same time. Obivously none of them
: are taking each other's CPU time "lock, stock and barrel".

Let us see here:
Microsoft Word: if in background; no use of CPU
MacDraw Pro : if in background; no use of CPU
Eudora : barely useful in background anyway ; if doing nothing
then no use of CPU

Try qouting some CPU intensive tasks why don't you. Like Photoshop, 3-d
programs, Term programs, formatting programs (hard-drive also),
networking programs, etc.

: >I am not arguing that the MAC can not do a "few" simple tasks without
: >screwing up but in it's current state the MAC can not outperform tht
: >loosing responsiveness/performance but the MAC will start loosing at
: >almost a geometric rate when the tasks start adding up.
: >-Wight Wolfe-

: Why do people feel the need to write "MAC"?
: --
: Jim Wong (jd-wong@uiuc.edu)

I don't know, if it's 'Mac', then so be it. I've seen it both ways.

Mac, Mac, Mac, Mac, Mac, Mac, Mac, Mac, Mac, Mac, Mac, Mac.

Okay I got my practice in, maybe I won't forget.

-Wight Wolfe-

PS: Try making more sense next time.

Picky, picky. At least it's better than "PC clown", "Windoze",
"Winblows", "Amigoid", "Amigadroid", "sh*tface", "f*ck you", and
the rest of the stuff we see in advocacy.

By the way, was that problem of spooling data to the Print
Monitor in applications like MacDraw Pro ever fixed, or does
this still lock the user out? How about the missing floppy disk
eject button? (Oooo, oooo--just threw that in for fun...)

There is a jpeg codec, but you shouldn't be using for compressing a video stream (unless you either a) are compressing just 1 frame, 2) your frame rate is measured in seconds per frame (like a slide show), or 3) you have a 200MHz PPC 620 :-). Normally you would use either the Apple video codec or the Cinepak codec. The video codec is much more symetrical (compresses & uncompresses at the same speed: note-I said much more, I did not say it was symetrical) while cinepak achieves much better compression r
aios at the cost of more time spent compressing. QuickTime also includes the Photo-jpeg, animation, graphics and (I think) Component Video. I've added the .avi codecs from Microsoft and the Intel Indeo codec. These are just extensions that live in the Extensions folder. Anyone with the QuickTime development kit can write a codec.

>16bit sound with a AD516.

I can't comment on the quality of HAM8, since I haven't seen it. As to your other comments, QuickTime does drop frames if it has to. This is as it should be, since there is no other way to maintain the time sync. The foundation is built, all Apple has to do is wait for the hardware to increase in power and their software gets more powerful (i.e., can do a high frame rate.) Does the Amiga sync the video & audio streams to real time (i.e., something recorded at 30 frames per second will play back at 30 f
ps, even if your machine could play it at a faster rate?)

>I do know something about Mac's. I still think that QT uses some sort of
>compression. What type is it? Or can it use any type you want?

As above, it depends on the compressor/decompressor that you use to encode the data.

>
>-Scott

This is very encouraging news. If anyone had doubts about letter writing
making a difference, here is your proof. Letters from consumers are taken
very seriously at these companies. The reason is that they don't know if
their games are in demand for the Jaguar. And you have to let them know that
they are in demand.
By the way, LucasArts makes the following games: Star Wars Rebel Assault,
X-Wing, Indiana Jones and the Fate of Atlantis, Monkey Island 2,
and the Day of the Tentacle.

Their fax number is: 415/721-3344.

The foundation is built, all Apple ha s to do is wait for the hardware to increase in power and their software gets more powerful (i.e., can do a high frame rate.) Does the Amiga sync the video & audio streams to real time (i.e., something recorded at 30 frames per second will play back at 3 0 fps, even if your machine could play it at a faster rate?)

The machine will play the anim at the speed it was supposed to, I am not
sure what happens if the machine can't play the anim and sound fast
enough though. It has never happened to me. Oh well I am sure
some Amiga person will tell you.

What I 'think' happens is that:
Anim and sound played
Anim slower than sound
Sound finishes first, anim plays it self out
Next frame in anim that is linked to another sound is played
and new sound is played.

Personally the only things that really need to be frame acurate are
specific sounds to the video in question. Such as: clapping of hands, or
the dropping of a hammer, etc. The music is not as important, but may be
if one needs a bomb at a certain time.

The Amiga doesn't screw up with frame acurate sounds, QT does. I am not
disputing that in the 'future' quicktime will be nice, but it isn't now.
And that is the main thing. Then again anims on the Amiga will also be
that much better. :-)

: >I do know something about Mac's. I still think that QT uses some sort of
: >compression. What type is it? Or can it use any type you want?

: As above, it depends on the compressor/decompressor that you use to encode the data.

Well at least a was right, Quicktime employs sometime type of
compression, whether it be any of the above stated or different, it does
have compression.

Oliver Breidenbach (Oliver@world.isar.de) wrote:
: Re: What about Atari?

: BTW, just in case anyone is interested:

: The German company Application Systems Heidelberg, which previously
: excelled in producing and distributing Atari ST Software (Signum 3 is
: their top title) now has released an Atari Emulator for the Apple
: Macintosh called MagiCMac.

MagicMAc is NOT an Atari emulator, but a fully grown TOS operating
system, if you want, a TOS clone (TOS is the name of Ataris opeating system).
On the Macintosh, howver, there is no hardware documenation available, so
writing a completely new operating system for the Mac is impossible.
To handle low level routines, Magic Mac refers to low level Mac OS
routines, because this is the ONLY way to implement an OS on a Macintosh,
if you are not working within Apple (BTW, has anybody heard of Linux for
Mac and how they solve that problem).
MacMagic apllications will be able to use the Macintoshfilesystem
directly and other Macspecific stuff (.e. diskeject) are also implemented
within MagicMac. In that sense, Magic Mac is an operatingsystem extension
for the Mac, which, BTW, with its additional features, will be supported
by all Atari software developers that curently support their software.
As for the lacking hardware (Centronics, Midi) there will be a plug in
card for the macintosh that can be used by MagicMac and Mac OS.

At the same time, there will be Magic 3 available, which replaces Atari
TOS (or MultiTOS) completely and is actively supported. It will provide
for preemptive multitasking, loadaable device drivers and filesystems
etc. and will be about several factors faster than Atari Single TOS. Both
versions are compatible (Macmagic and Magic 3), whichis also shown in the
fact, that a Mac filesystem driver will be available for the
Atariversion, i.e. Macintosh hd, for example, can be used directly with
the Atari machine and the applcations cntake advantage of long file names
etc.....

Magic has nothing to do with Atari, it exists seperately. Thus,
developent of Atri softawre will get independent of all Atari stuff and
the fate of Atari becomes very little interesting even for those who
program Atari soft.

A PPC Macintosh version of Magic is defeintely in the designing
process. The main work has t be done with the PMMU, as the 68k emuator on
the PPC Macs do not emulate a 68030/40 vompatible one. For native Magic
applications we will have to hear the staements on the side of Thomas

Tempelmann.

It is also possible, that Magic will be ported not just as an OS extension, but as a fuly grown OS onto PreP PowerPc etc., which many people have asked for.

Magic in its base version has less features than MacOS, but hasimportant davantages over MacOS, i.e. preemptive multitasking. It is also MUCh faster than any other current OS with graphical userinterface and makes better use of system ressources, i.e. it will run with less RAM, less HD space than any other comprable OS.

regards,

Alfred

Does Cubase Audio 2.x be run on a Falcon (16Mb/FPU) under Magic 3?
A friend of mine just bought Geneva, and Cubase Score 2 runs happily in it.
What about eg. ICD hard disk driver - does Magic 3 override it?

Everyone knows that FAXING is much cheaper than sending mail through the U.S. postal service. Also, a lot of people have FAX modems and FAX software for their PCs...

So if you are interested in seeing some of these companies making games for the Jaguar, why not FAX them and let them know? The FAX number has been included for each of these companies.

Capcom USA Inc.
LucasArts Entertainment Co.
NovaLogic
Virgin Games
Spectrum Holobyte
Psygnosis
MicroProse

>>>>>>>>>>>>>>>>>>>>>>> Capcom USA INC. <<<<<<<<<<<<<<<<<<<<<<<

Capcom is known for producing the Street Fighter II series of games. The company is also known for producing games such as The Great Circus Mystery Starring Mickey & Minnie Mouse, Demon's Crest, and Saturday Night Slam Masters. The company also does conversions of popular titles such as Wizardry V and Eye of the Beholder.

Super Street Fighter II Turbo is second only to Mortal Kombat II on the most wanted games for the Jaguar CAIN Newsletter listing. If the game existed for the Jaguar, it would no doubt sell a lot of Jaguars. But Capcom is not making Super Street Fighter for the Jaguar and no plans have been announced to do so in the near future.

The strange thing is that Capcom is making Super Street Fighter II Turbo for the 3DO platform. The game will even have better graphics than that on the SNES and Genesis. But this only means that if Capcom will make a version of SSFIIT for a much higher-priced system than there is a chance that the company will be willing to make a Jaguar version.

The mailing address for Capcom USA Inc. is:

Scott Smith
Product-Development Coordinator
Capcom USA Inc.
475 Oakmead Parkway
Sunnyvale, CA 94086

The following is a list of things in which you may want to say in your letter to Capcom USA Inc.:

Mr. Smith,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get Super Street Fighter II Turbo for the Jaguar as soon as it is released.
6) Thank you to Mr. Smith for reading your letter and for considering making Super Street Fighter II Turbo for the Jaguar.

You may also want to FAX Capcom USA by the phone number: 408/774-3995. But sending mail through the U.S. Postal Service may prove to be more successful.

>>>>>>>>>>>>>>>>>>> LucasArts Entertainment Co. <<<<<<<<<<<<<<<<<<<

LucasArts is famous for making games based on popular movies. The company has also has several popular titles out for the PC. Some of these titles are: Star Wars Rebel Assault, X-Wing, Indiana Jones and the Fate of Atlantis, Monkey Island 2: Le chuck's Revenge, and Day of the Tentacle. And LucasArts also has the rights to BallBlazer which is still a popular game and enjoyed by many.

The mailing address for LucasArts is:

LucasArts Entertainment Co.
LucasArts Games Division
P.O. Box 10307
San Rafael, CA 94912

The following is a list of things in which you may want to say in your letter to LucasArts:

Dear Sir or Madam,

1) How much you enjoy LucasArts games.
2) How much you enjoy the Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games you would love to see on the Jaguar (choose two or three LucasArts games).
5) How you believe LucasArts games would be fantastic on the Atari Jaguar.
6) How you will run out and buy LucasArts games when they are made for the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX LucasArts by the phone number: 415/721-3344.

>>>>>>>>>>>>>>>>>>>>>>>>>>>> NovaLogic <<<<<<<<<<<<<<<<<<<<<<<<<<<<

NovaLogic is known for its high-quality games on the PC. The president and CEO, John Garcia makes sure each game title released is of the highest quality. NovaLogic is known for producing Comanche: Maximum Overkill (a game title that rated high on the Most Wanted Games for the Jaguar listing from CAIN Newsletter). The company also produced WolfPack (a submarine simulator) and UltraBots. The latest and greatest game from NovaLogic is Armored Fist. This game is highly praised by reviewers that have seen it.

John Garcia is interested in producing modem games and networking games in the future. NovaLogic's games would be a great addition to the Jaguar game library.

The mailing address for NovaLogic is:

John Garcia, President
NovaLogic
19510 Ventura Blvd.
Suite 200
Tarzana, CA 91356

The following is a list of things in which you may want to say in your letter to NovaLogic:

Dear Mr. Garcia,

1) How much you enjoy NovaLogic games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple of NovaLogic games).
5) How you believe that NovaLogic games will be even more fantastic when using the graphics and sound capabilities of the Jaguar.
6) How you would like to see NovaLogic games that use the Jaguar voice-modem and networking capabilities.
7) How you will run out and buy NovaLogic games when they are produced for the Jaguar.
8) Thank Mr. Garcia for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX NovaLogic by the phone number: 818/774-0684. Please consider writing NovaLogic through the U.S. mail first and then FAX NovaLogic.

>>>>>>>>>>>>>>>>>>>>>>>>>>>> Virgin Games <<<<<<<<<<<<<<<<<<<<<<<<<<<<

Virgin Games is already a Jaguar developer, so this letter is mainly to thank the company and to encourage them to make more titles for the Jaguar. Virgin is suppose to be making Cannon Fodder, Demolition Man, and

Dragon for the Jaguar. The company is also planning to make a CD-ROM game called Creature Shock for the Jaguar.

Virgin Games is known for making a popular PC CD-ROM game called: The 7th Guest. It has also made Land of Lore, Dune II, and Indy Car Racing. It will also be releasing 11th Hour and Command & Conquer for the PC soon.

The mailing address for Virgin Games is:

Virgin Games
18061 Fitch Avenue
Irvine, CA 92714

The following is a list of things in which you may want to say in your letter to Virgin Games:

Dear Sir or Madam,

1) How you enjoy Virgin Games' games.
2) How much you enjoy the Atari Jaguar.
3) How you are really happy that Virgin Games is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games such as The 7th Guest (and name a few) besides the ones the company is already making for the Jaguar.
6) How you would like to see the Jaguar modem and network features used in Virgin Games' software (OPTIONAL).
7) How you will run out and buy Virgin Games' games when they are produced for the Jaguar.
8) Thank you to the person for reading your letter and for producing games for the Jaguar.

You may also want to FAX Virgin Games by the phone number: 714/833-8717.

>>>>>>>>>>>>>>>>>>>>>>> Spectrum Holobyte <<<<<<<<<<<<<<<<<<<<<<<

Spectrum Holobyte is famous for their Falcon flight simulator game. The game can even be played through the modem on PCs. Spectrum Holobyte has just released Fields of Glory and is rumored to be working on Falcon 4.0.

Modem games is something that a game system must have if it will be successful in the future. And Spectrum Holobyte is well-known for their modem games. Falcon 4.0 sounds like it would be perfect for the Jaguar.

The mailing address for Spectrum Holobyte is:

Barry J. Folsom, President
Spectrum Holobyte

2490 Mariners Square Loop
Alameda, CA 94501

The following is a list of things in which you may want to say in your letter to Spectrum Holobyte:

Dear Mr. Folsom,

1) How much you enjoy Spectrum Holobyte games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) How you would like to see Falcon 4.0 with voice-modem and networking capabilities on the Jaguar.
5) How you would like to see Fields of Glory and other Spectrum Holobyte games for the Jaguar.
6) How you believe Spectrum Holobyte games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Spectrum Holobyte games when they are produced for the Jaguar.
8) Thank Mr. Folsom for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX Spectrum Holobyte by the phone number: 510/522-2138. But please keep in mind that sending a letter through the U.S. Postal Service may be more effective.

>>>>>>>>>>>>>>>>>>>>>>>>>> Psygnosis <<<<<<<<<<<<<<<<<<<<<<<<<<

Psygnosis is a well known producer of video games. A few of Psygnosis' popular games are Microcosm, Shadow of the Best II, and Puggsy. A recent game is Hexx: Heresy of the Wizard. TThe company has also done Lemmings.

The mailing address for Psygnosis is:

Psygnosis
675 Massachusetts Ave.
Cambridge, MA 02139

The following is a list of things in which you may want to say in your letter to Psygnosis:

Dear Sir or Madam,

1) How much you enjoy Psygnosis games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple of Pysgnosis games).
5) How you believe Psygnosis games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Psygnosis games when they are produced

for the Jaguar.
7) Thank the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX Psygnosis by the phone number: 617/497-6759.

>>>>>>>>>>>>>>>>>>>>>>>> MicroProse Inc. <<<<<<<<<<<<<<<<<<<<<<<<

MicroProse is already developing Jaguar games so this letter will be mainly to thank MicroProse and encourage the company to make more of their games for the Jaguar. MicroProse is supposedly making Grand Prix, Gunship 2000, and possibly Star Trek: The Next Generation game. But MicroProse has made a lot of fantastic games for the PC that should really be made for the Jaguar. These include: World Circuit, Fleet Defender, Master of Orion, and Civilization. Civilization has already been made for the Falcon030 so it may not be too hard to convert the game to the Jaguar. Since Jaguar can save games on cartridge, it may be possible to make Civilization on the Jaguar. MicroProse is also making Across the Rhine, Colonization, and Masters of Magic.

MicroProse is indeed a very good company to have making Jaguar games. The quality has always been good and it would be nice for the company to make a lot of their games for the Jaguar.

The mailing address for MicroProse is:

Ronald J. Bueche, CEO
MicroProse Inc.
180 Lakefront Dr.
Hunt Valley, MD 21030-2245

The following is a list of things in which you may want to say in your letter to MicroProse:

Dear Mr. Bueche,

1) How much you enjoy MicroProse games.
2) How much you enjoy your Atari Jaguar.
3) How you are really glad that MicroProse is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games besides Gunship 2000 and Grand Prix be made for the Jaguar (name a few of your favorite MicroProse games).
6) How you would like to see the Jaguar voice modem and network capabilities used in MicroProse games. (OPTIONAL)
7) How you will run out and buy MicroProse games when they are produced for the Jaguar.
8) Thank you to Mr. Bueche for reading your letter and for making games for the Jaguar.

You may also want to FAX MicroProse at the phone number: 410/771-1174.
But only FAX MicroProse if you do not have time to mail the letter or if
you have already sent mail to the company.

********** THANK YOU! **********

: : >powertools. IN fact no one can do anything else while rendering in KAI's
: : >since that program stops rendering when you hit a mouse button. That
: : >is so dumb. Well you can do something, you can watch the thing render
: : >for an hour.

: : This is done on the theory that if you are rendering, you wish to be done
: : as -soon- as possible, hence nothing should run that might slow things.

: Well this may be true, but IMHO waiting a few more seconds for a render and
: still being abel to other things is in the best way to go. Besides what is
: the user supposd to do while he render goes on? Play with the pencil
: on their desks, or use another computer (given that they had one)?
: Personally if you think that the render sceem was done on purpose then
: so be it but it was a dumb idea.

: In fact to tell you the truth if i were running to apps on the Amiga the
: total amount of time both tasks would tkae up would be less than if I waited
: for one to finish and started another.

: : Modem downloads and modplaying isn't a problem.

: : >There are major flaws in the way that the MAC multi-tasks, it does multi-task
: : >it just doesn't switch between apps intelligently or frequently enough.

: : Multitask that Amiga and any game. I can do exactly that with my Mac and
: : 95% of the games out there, all of which would allow a 28.8k download and
: : gameplaying at the same time.

: What type of MAC do you have? Besides the terminal programs on the MAC
: totlaly suck IMHO compared to some on the AMIGA. Besides another thing is
: that if I were to have a game that actually allowed multi-tasking on my
: Amiga then it would run and perform much better than on a MAC.

: The OS on the Amiga is much better at multi-tasking than the MAC's is.
: Were not talking about application availability just straight OS performance.

: : Both systems have flaws. Mac multitasking is far from perfect, but I gave
: : up Amiga multitasking in order to get the best apps available for any
: : computer when I got my P60 and Q700. Multitasking does not a computer
: : make. I run it for apps, not to see how fast I can hit Amiga-M to flip

: : between 20 screens.

: Well my Amiga suits me quite well and if there isn't a praticular app
: that I like on the Amiga then I just fir up my Emplant. You software
: availability is completely and totally moot in this instance.

Really? I didn't now Emplant could run PowerMac native software? Wow!

David

5278. Re: 1994 Jaguar Letter Writing Campaign (complete!)

Newsgroup: comp.sys.atari.advocacy
Date: 1994-12-17 23:41:37 UTC
From: healy@nosc.mil
Message-ID: <1994Dec17.234137.23370@nosc.mil>
Source record: 14177
Cross-posted to: rec.games.video.atari,rec.games.video.misc,alt.games.lynx,comp.sys.atari.advocacy

Sorry if this is the wrong group, but I don't have any newsgroups
at my site with jaguar in their name.

Does anyone know where I could get a list of games available for
the Jaguar and where I could get a Jaguar itself (I live in
San Diego CA)? My daughter wants a SEGA pretty badly but if the
Jag had enough games that she liked, I'd probably give it a go.

Email replies would be appreciated as I don't get into the
advocacy group, what with comp.sys.atari.st, comp.sys.atari.st.tech,
comp.sys.atari.programmer and even worse rec.music.guitar. Well,
you get the idea.

Thanks for any assistance,

Mike Healy

healy@nosc.mil

>>
>>Give us a fukkin break.
>>

>Oh, C'mon John. Now don't tell me that you don't have paging on! Who
>reads messages without paging?

I have paging on but if I figure an article will be short and something I'm interested in I hit an uppercase "N" and let the message scroll by. I'm a fast enough reader that I can usually catch all I need as it flies by and if not I'll use my scrollback buffer to review it. Much less trouble than having to hit SPACE at the end of each screen.

>All you have to do is press "q" after the first page if you don't want
>to read it anymore. It is THAT simple!

The simplest would be to either keep non-Lynx related posts out of this newsgroup or make it known in the subject line that it's about the Jag. The purpose of the different newsgroups is to segregate the postings according to the reader's interests. Why not respect that?

>I don't know if you have noticed or not, but the Lynx -is- an Atari
>product so alt.games.lynx is an Atari newsgroup. Some people don't
>check out the other newsgroups and own a Jaguar.

It's an Atari *LYNX* newsgroup. "Lynx" is a subset of Atari. "Atari" is not a subset of Lynx. It has no more business there than a Mac posting would have in the Apple II newsgroup.

If you think that there are some stray Jag owners lost in alt.games.lynx why don't you just make a post guiding them to rec.games.video.atari instead of trying to move rgva here.

>I'm going to be releasing a Lynx Letter Writing Campaign next month and
>I'm going to post it in the Jaguar newsgroup too! If you don't like

>that, tough! <g>
>
>Len

Actually I don't like it. <no_g> There's too much crossposting-anarchy already and I hate to see anyone contributing to it, even for a cause that I'm sympathetic to.

BTW -in case you don't remember- we met at the Chardin Atarifest. I have 3 Lynx in the house with about 40 titles, a Jag with 6 titles and well over 300 titles for my Atari 2600 and 7800. I'm not anti-Atari by any stretch of the imagination. I just think that newsgroups should be respected.

John Daniels

Wight Wolfe (ryan@shell.portal.com) wrote:
: David Corn (dcorn@metronet.com) wrote:
: : In article <3cl826$r1u@marton.hsr.no>, lolsen@hsr.no (Lasse Olsen) wrote:

: : > Well, playing two or three anims (each maybe 320x240 and at least 8bit)

: : Why not just go full screen, CINEPAK compression, 32k color 15 bit
: : graphics, syncronized 16 bit sound, and ability to resize windows?
: : Oh..the Amiga can't. Nevermind...

: This is pathetic, why resize the window if you can look at it full screen
: in all it's glory at full speed? IMHO the resizing thing is a joke.

Why does the Amiga allow you to resize windows anyway? It should be
able to read your mind and place a fixed sized window just where you
want it.

: Oh and BTW: Only the newest most powerful macs can do the above at even a
: moderate speed at very high res. Are youeven aware of how much date must
: come off the hard-drive in order for the above media to be played on a MAC?
: It's more than a MAC without a disk array can do, that's for sure.

Duh. Since the video must come off a hard drive (even for the Amiga Flyer)
the drive will be the limiting factor. Computers can handle data much
faster than hard drives can deliver.

: : IFF7 is very fast, but I think you've got to look at what's being done -
: : next to no compression (c'mon - DELTA compression? G's!), no

: Umm.... HAM? That's pretty damn good compression if I must say so. Much
: better than pathetic QT2.0.

Which compressor in QT2.0 are you comparing HAM to? And why don't you
just write a HAM compressor and drop it in? Or didn't you know you
could do that. QT2.0 does not have "built-in" compression, but allows
you to select the compressor based upon the type of data it is called
upon to compress.

: : syncronization with sound, no syncronization with the CPU's speed, no
: : ability to resize windows, and only a limited ability to use "OLE" like
: : functions with it (like placing IFF7 anims into documents, among other
: : things. It's not an OS service like QT2.0 is.) There is also no device
: : independence in output, so a 24 bit anim can't dither to a 15 bit anim
: : without a -lot- of extra programming, something QT2.0 does all ON THE
: : FLY.
: On the fly slowly that is.

Someone give this guy a manual. Of course on the fly video image conversion
is going to be slower than just blasting the bits. It's good enough for
a preview and you CAN just copy the movie and have it converted to whatever
bit depth you want for the same blazing speed as the original, though
with less resolution if you are moving downward in bit depth. QT2.0
allows one to view a movie in a case when the Amiga would simply choke.

: I hope you don't think that QT2.0 is superior to the Amiga in anim
: playback. The only two things it has going for it are: built in sound
: support, and integration into applications. Believe me those are really
: nice things to have but... The sound support is pretty pathetic, the
: sychronization with sound sucks royally. Apple still hasn't gotten it to
: work correctly yet. The Amiga has always been superior in the sound
: sychronization arena. Hell if I play the same anim back on a MAC more than
: once the sound and video don't match up every single time the same way. Now
: that's pathetic. BTW: I was running this on a Centris 650 with 16mb and
: a few apps loaded in the background. Which goes to say that either the
: cooperation tasking is at fault, QT was at fault, or the MAC hardware can't
: handle anims as well as the AMIGA. I'd say it was a little of both.

QT2.0 IS superior. We have a Toaster at school (running on a 4000) and
it CAN'T play full-frame hi-res animations at 30fps which we need to
output to tape. We had to buy a completely new edit suite (AmiLink) with
a time-code single frame recorder to output our animations. This means
that it takes HOURS to output an animation to tape, since the recorder
must rewind and play 5 seconds of pre-roll to allow the tape to come
up to speed to record a SINGLE frame, then it stops, rewinds and does the
same thing over and over and over... you get the idea. Don't get me
wrong, I LOVE the Toaster. It's really cool. It's just saddled with
a less than optimal machine.

: : > without a glitch - maybe from three seperate HD's, while playing

: : 3 hard drives? One isn't enough? :)

: No, more than one would be a good test on how well the computer could
: interact with the SCSI bus and the hard-drives connected to it.

Check out the smiley. He was making a reference to the single vs.
multiple monitor dispute. According to some Aminga pundits, less
is more. :)

: : > some decent music (not cd-rom). Why don't we throw in a decent game

: : This doesn't matter.

: Why not? It would only bog the MAC down even more if it were playing
: music, is that why you don't want to play any?

Your point. It would be nice if mac hardware had more chips to handle
those chores. The best thing is that if Apple does decide to make
a more capable mac, programs that play sound will improve automatically
since they all (at least after the introduction of the Sound Manager 3.0 :))
go through the Sound Manager. Check out "Inside Macintosh: Sound" for

a glimpse!

: : > (Simcity2000?) and print a 500K document, extracting a 5mb archive

: : SimCity 2000? Boy, can you say --SLOW-- on an Amiga? Dear God, if
: : anything that was a -bad- game to bring up. For all of the Amiga's
: : supposed speed, try, just -try-, running this on a hires interlaced screen
: : in 8 bit color (deinterlaced on aga, naturally.) Slowwww....in fact, try
: : running Workbench in 8 bit deinterlaced resolution. Dear GOD this thing
: : gets slow in "hires" 640x480x8bits!

: : Printing? No problem.

: Apples Print Managing program is very well done, I really haven't seen to
: much of a performance hit when printing. It might slow a bit, but the
: printing isn't exactly a CPU hog.

As cool as LaserWriter printing may be, I have more access to a StyleWriter.
I love my Mac, but I defy anyone to say printing to the StyleWriter
(background mode, remember, we want to get on with other tasks) does
not slow the machine down appreciably. Maybe I need a better printer.

: : > (in ram) and while we're at it, another game (tex mapped if you will,

: : No problem, but putting the dearchiver in the background will slow down,
: : admittedly.

: The dearchiver would slow down on any machine if the machine were running
: more than one CPU intensive task. Buy have you ever tried to compress
: more than one thing at a time? Or how about uncompressing at the same time?
: I have compressed (27) different directories all at the same time on the
: same hard-drive, needless to say the hidrance there was he hard-drive
: speed not the multi-tasking or the compression program.

Agreed about the hard-drives being slow. But ANY process using CPU time
will slow down others competing for the same resource. Unless you have
multiple CPUs to throw at other processes, of course.

: : > of course with some speed loss, but still very stable and firm)
: : > and do some 24-bit painting and manipulation (wich I did this trough
: : > my Emplant-card using Photoshop) and maybe run some kind of PC

: : Ah, using real applications now, I see. :)

: I know this was a joke but define "REAL APPLICATIONS".

Try running PowerMac native software under Emplant. Even the lowly freebee
graphing calculator that comes with System 7.5. That is what *I*
consider "REAL APPLICATION" software! :)

: : > emulation at the same time (I run the game Zaxxon)...

: : 198...2? 1983? Load up SoftWindows. Hey, how's Emplant/PC working these
: : days? :)

: Softwindows sucks compared to Emplant's MAC emulation. Softwindows
: doesn't come anywhere near the same performance as Emplant does. Besides
: there are other PC Emulators.

Really? A software emulation solution sucks compared to running the real
thing? That's news to me. :) Try this. Run SoftWindows under Emplant.
Since the Emplant's MAC emulation is so good, it should be able to handle
SoftWindows with nor problem!

: : > This is by no means the limit for the Amiga to remain stable but
: : > if a Mac is able to do anything similar I'm eating the dust.. :-)

: : The Amiga can run old apps well. The question comes into being when you
: : attempt to run modern 1994-style applications on it. Then, it starts
: : fading fast, IMO.

: What modern Amiga programs are slow? There are many program on my machine
: that are modern, and they don't slow down the machine half as much as
: Apps. do on the MAC.

Please list your modern programs and how they compare functionally to
similar (they don't even have to be the same!) Macintosh applications.
Again, I love the Toaster on the Amiga, but as far as "productivity"
applications go, there's not even any programs that can be compared.

: : --
: : Please copy all replies to my e-mail address.
: : Please quote.

: NO

Would it really have been that hard to send the guy a reply? Or
can't the Amiga do that?

Number of games is important, but if you have
a high price, your machine just won't sell. Take
a look at the Neo-Geo market share...

Dude, he meant that on the Mac they made programs to play mods
explicitly with the purpose and requirement of playing in the background.
On the amiga, this was a given. and yes, I know you also made a joke :-)

There was an Atari 130ST. You may not have ever seen it, but it was
there - I may even have the issue of A.N.A.L.O.G. that had the advert for
the company that I ordered it from. (Or maybe it was Antic - it's been a
while. :) The 130ST was, as the name suggests, a 128K ST. (And if there
was a 260ST (I never saw one) it would have been 256K, therefore NOT
identical to the 520ST...)

: : : > Well, playing two or three anims (each maybe 320x240 and at least 8bit)

: : : Why not just go full screen, CINEPAK compression, 32k color 15 bit
: : : graphics, syncronized 16 bit sound, and ability to resize windows?
: : : Oh..the Amiga can't. Nevermind...

: : This is pathetic, why resize the window if you can look at it full screen
: : in all it's glory at full speed? IMHO the resizing thing is a joke.

: Why does the Amiga allow you to resize windows anyway? It should be
: able to read your mind and place a fixed sized window just where you
: want it.

Wouldn't it be nice if it did? But seriously, I was just saying that for
my uses full screen is much nicer than a small little window. Even for
previews, IMHO.

: : Oh and BTW: Only the newest most powerful macs can do the above at even a
: : moderate speed at very high res. Are youeven aware of how much date must
: : come off the hard-drive in order for the above media to be played on a MAC?
: : It's more than a MAC without a disk array can do, that's for sure.

: Duh. Since the video must come off a hard drive (even for the Amiga Flyer)
: the drive will be the limiting factor. Computers can handle data much
: faster than hard drives can deliver.

Well, the point was that, for quicktime: the compression routine is
handled by the CPU, so if one were to have a slow CPU for a Full Screen
16bit anim on an 040 then he/she will be slowed by the hard-drive speed.
Because the anim will need to be compressed very little for that CPU,
since it would not be able to uncompress the anim as fast as a PowerPC
601/80 would. On the AMIGA the chipset does the uncompression for the
CPU, plus the data for the HAM8 picture is in 8bit size format. This
just means that for comparative CPU's (040's) the Amiga can play an anim
faster than a Mac. When we go into the PowerPC range then all bets are
off, I don't know if it can do as well as an Amiga4000, becasue I haven't
seen one play an awesome anim yet. Just those stupid ugly space-saver
anims at Fry's.

: : : IFF7 is very fast, but I think you've got to look at what's being done -
: : : next to no compression (c'mon - DELTA compression? G's!), no

: : Umm.... HAM? That's pretty damn good compression if I must say so. Much
: : better than pathetic QT2.0.

: Which compressor in QT2.0 are you comparing HAM to? And why don't you
: just write a HAM compressor and drop it in? Or didn't you know you
: could do that. QT2.0 does not have "built-in" compression, but allows
: you to select the compressor based upon the type of data it is called
: upon to compress.

I now about the compression sceam on QT now, I didn't when I posted this
message you are responding to. But HAM8 takes much less CPU time than a
QT anim no matter what compression sceam used. (Unless it is routed to an
mpeg board, which I think is possible)

Well about the built in compression thing, OS3.1 on the Amiga does have
something called "datatypes" this allows programs that are data-type
aware to use the data-types for that machine. Example: I have a program
that is data-type aware, and since I have data-types for: jpeg, gif, iff,
8svx, AmigaGuide, ANIM, CDXL, FTXT, X-bitmap, Sun Audio, Windows Bitmap,
Windows Icon, MacPaint, PCX. The program can handle any of those and
display/play any of them. This goes the same for any other program. So
it is possible for someone to create a data-type for Anim5-32 and stick
them in the data-types directory for other programs to use. The
functionality is there, some of us just have to wait until some one else
implements them well. There is an ANIM data-type but I haven't tested it
fully yet. I like using a different player.

: : : syncronization with sound, no syncronization with the CPU's speed, no
: : : ability to resize windows, and only a limited ability to use "OLE" like
: : : functions with it (like placing IFF7 anims into documents, among other
: : : things. It's not an OS service like QT2.0 is.) There is also no device
: : : independence in output, so a 24 bit anim can't dither to a 15 bit anim
: : : without a -lot- of extra programming, something QT2.0 does all ON THE
: : : FLY.
: : On the fly slowly that is.

: Someone give this guy a manual. Of course on the fly video image conversion
: is going to be slower than just blasting the bits. It's good enough for
: a preview and you CAN just copy the movie and have it converted to whatever
: bit depth you want for the same blazing speed as the original, though
: with less resolution if you are moving downward in bit depth. QT2.0
: allows one to view a movie in a case when the Amiga would simply choke.

The point was that, I don't want my anim slowing down for anything,
including dithering from one bit res to another. The Amiga has a custom
chipset that is pretty standard across the range. (At least between
chipset types) so it is safe to say that one anim that works on one
machine will work on another, just as well. Although I do want to see,
redirectability in the gfx arena on the Amiga. If that happens then
there probably will be something like QT on the Amiga in that sense.

: : I hope you don't think that QT2.0 is superior to the Amiga in anim
: : playback. The only two things it has going for it are: built in sound

: : support, and integration into applications. Believe me those are really
: : nice things to have but... The sound support is pretty pathetic, the
: : sychronization with sound sucks royally. Apple still hasn't gotten it to
: : work correctly yet. The Amiga has always been superior in the sound
: : sychronization arena. Hell if I play the same anim back on a MAC more than
: : once the sound and video don't match up every single time the same way. Now
: : that's pathetic. BTW: I was running this on a Centris 650 with 16mb and
: : a few apps loaded in the background. Which goes to say that either the
: : cooperation tasking is at fault, QT was at fault, or the MAC hardware can't
: : handle anims as well as the AMIGA. I'd say it was a little of both.

: QT2.0 IS superior. We have a Toaster at school (running on a 4000) and
: it CAN'T play full-frame hi-res animations at 30fps which we need to
: output to tape. We had to buy a completely new edit suite (AmiLink) with
: a time-code single frame recorder to output our animations. This means
: that it takes HOURS to output an animation to tape, since the recorder
: must rewind and play 5 seconds of pre-roll to allow the tape to come
: up to speed to record a SINGLE frame, then it stops, rewinds and does the
: same thing over and over and over... you get the idea. Don't get me
: wrong, I LOVE the Toaster. It's really cool. It's just saddled with
: a less than optimal machine.

QT is superior in somethings, it is not very good on a lower than PowerPC
Mac though. Our anim format is really nice for the same cpu you use. Of
course there is a little unfairness in the sense that Amiga's have a
chipset to handle it. Personally, you probably didn't have enough ram on
the machine, QT can't play anims for that long either, why do you think there
are non-linear systems out for the MAC (one's that cost in the 20-30
thousand dollar range) because those companies that make them, think QT
isn't as good as it could be, or should be. This goes the same for the
Newtek flyer, the flyer is a 5,000 dollar non-linear system for the Amiga
and Newtek built it cause no one has enough money to buy memory by the gig
for the Amiga. The only thing is, QT on any non-PowerPC is not going to
be able to keep up with an Amiga4000. PowerPC's are in question, some
say it CAN do it, some say it can't. Until I see it can, I won't believe it.
If you think it can, then more power to you.

: : : > without a glitch - maybe from three seperate HD's, while playing

: : : 3 hard drives? One isn't enough? :)

: : No, more than one would be a good test on how well the computer could
: : interact with the SCSI bus and the hard-drives connected to it.

: Check out the smiley. He was making a reference to the single vs.
: multiple monitor dispute. According to some Aminga pundits, less
: is more. :)

Whatever.

: : : > some decent music (not cd-rom). Why don't we throw in a decent game

: : : This doesn't matter.

: : Why not? It would only bog the MAC down even more if it were playing
: : music, is that why you don't want to play any?

: Your point. It would be nice if mac hardware had more chips to handle
: those chores. The best thing is that if Apple does decide to make
: a more capable mac, programs that play sound will improve automatically
: since they all (at least after the introduction of the Sound Manager 3.0 :))
: go through the Sound Manager. Check out "Inside Macintosh: Sound" for
: a glimpse!

That is why Commodore has kept hard-ware compatibility, I can see where
software compatibility might be better, in the sense that one doesn't
have to watch out for keeping a high degree of hardware compatibility,
then they can devise whole new chips and not worry about a thing until it
comes to software. But on the Amiga they don't worry about software they
just worry about the hardware, and build in the compatibility there.
This is where the non-redirecting problem stems from.
Then again for the MAC there is a little more overhead in the software
that interprets commands for the newer chipset than if the chipset just
figured it out for itself lie on the Amiga.

: : : > (Simcity2000?) and print a 500K document, extracting a 5mb archive

: : : SimCity 2000? Boy, can you say --SLOW-- on an Amiga? Dear God, if
: : : anything that was a -bad- game to bring up. For all of the Amiga's
: : : supposed speed, try, just -try-, running this on a hires interlaced screen
: : : in 8 bit color (deinterlaced on aga, naturally.) Slowwww....in fact, try
: : : running Workbench in 8 bit deinterlaced resolution. Dear GOD this thing
: : : gets slow in "hires" 640x480x8bits!

: : : Printing? No problem.

: : Apples Print Managing program is very well done, I really haven't seen to
: : much of a performance hit when printing. It might slow a bit, but the
: : printing isn't exactly a CPU hog.

: As cool as LaserWriter printing may be, I have more access to a StyleWriter.
: I love my Mac, but I defy anyone to say printing to the StyleWriter
: (background mode, remember, we want to get on with other tasks) does
: not slow the machine down appreciably. Maybe I need a better printer.

So Printing is a problem then? Hmmm, I guess it's not up to par in that
area yet. What may be happening is that for the Apple Print Manager, the
style writer needs to have data copied to it more often so it slows the
Mac down more than a laserwriter.

Just a tip, there are different Print Managers out there for the MAC, if you
want I can give some names of some, they might help. I have heard that
they help in the area tha your having problems with.

: : : > (in ram) and while we're at it, another game (tex mapped if you will,

: : : No problem, but putting the dearchiver in the background will slow down,
: : : admittedly.

: : The dearchiver would slow down on any machine if the machine were running
: : more than one CPU intensive task. Buy have you ever tried to compress
: : more than one thing at a time? Or how about uncompressing at the same time?
: : I have compressed (27) different directories all at the same time on the
: : same hard-drive, needless to say the hidrance there was he hard-drive
: : speed not the multi-tasking or the compression program.

: Agreed about the hard-drives being slow. But ANY process using CPU time
: will slow down others competing for the same resource. Unless you have
: multiple CPUs to throw at other processes, of course.

Yes but not an Amiga as much as on the MAC. I can't even compress that
much stuff at once on the MAC.

: : : > of course with some speed loss, but still very stable and firm)
: : : > and do some 24-bit painting and manipulation (wich I did this trough
: : : > my Emplant-card using Photoshop) and maybe run some kind of PC

: : : Ah, using real applications now, I see. :)

: : I know this was a joke but define "REAL APPLICATIONS".

: Try running PowerMac native software under Emplant. Even the lowly freebee
: graphing calculator that comes with System 7.5. That is what *I*
: consider "REAL APPLICATION" software! :)

: : : > emulation at the same time (I run the game Zaxxon)...

: : : 198...2? 1983? Load up SoftWindows. Hey, how's Emplant/PC working these
: : : days? :)

: : Softwindows sucks compared to Emplant's MAC emulation. Softwindows
: : doesn't come anywhere near the same performance as Emplant does. Besides
: : there are other PC Emulators.

: Really? A software emulation solution sucks compared to running the real
: thing? That's news to me. :) Try this. Run SoftWindows under Emplant.
: Since the Emplant's MAC emulation is so good, it should be able to handle
: SoftWindows with nor problem!

Emplant is a software emulation of sorts, but not as far gone, as
emulating a whole new chipset. My 040/25 Amiga is just as fast as my
friends Centris 650 040/25. What do you say about that? Seems to be a
bit better than Softwindows, don't you think?

Besides why would I want to run Softwindows, if I can run the same
software on one of my two machines. I am sure that everthing that I
would want to run is going to be on the Mac. The Mac's got some great
stuff out for it, and System7.5 is much nicer to use than any OS on the
PC, IMHO.

: : : > This is by no means the limit for the Amiga to remain stable but
: : : > if a Mac is able to do anything similar I'm eating the dust.. :-)

: : : The Amiga can run old apps well. The question comes into being when you
: : : attempt to run modern 1994-style applications on it. Then, it starts

: : : fading fast, IMO.

: : What modern Amiga programs are slow? There are many program on my machine
: : that are modern, and they don't slow down the machine half as much as
: : Apps. do on the MAC.

: Please list your modern programs and how they compare functionally to
: similar (they don't even have to be the same!) Macintosh applications.
: Again, I love the Toaster on the Amiga, but as far as "productivity"
: applications go, there's not even any programs that can be compared.

I was asking him to list the ones that are slow, Adpro is faster than
Photoshop on the same CPU, ImageFX is nice also. Paint programs, are
great, modem programs are without a doubt more functional and more
responsive on an Amiga than a comparativily equipped Mac.
Word-Processors are quick also, I just couldn't see how he could say that
modern Amiga program were slower than a Mac app. If anything they are
the same or a little faster on comparative processors.

: : : --
: : : Please copy all replies to my e-mail address.
: : : Please quote.

: : NO

: Would it really have been that hard to send the guy a reply? Or
: can't the Amiga do that?

I am using, tin, through my shell account. But I bet it could
if I had the connection to the internet I would need.

: : -Wight Wolfe-

I am not saying that the Mac is a useless piece of sh*t, I am just saying
that the Amiga is not as bad as some of you think it is. I use Macs alot
and I like alot of things about them. There are just a few things about
them that aren't up to par yet. The major thing is the multi-tasking,
the next is the anim play back. QT is nice for previews but I couldn't
output to tape on the Mac like I do on the Amiga.

For my uses I want feel and responsiveness, the MAC and it's OS just
don't provide that for me. I constantly, swithc between programs,a nd
constantly start and stop tasks, things like that are hard to do, on the
Mac at the same speed that I can do them on the Amiga.

For instance, can you load Phtoshop and do something else while it loads?
NO? Oh I'm sorry.

Also, there are many a time when I am on the modem and I
download a PIC that is just plain huge, and I want ot convert it to
something smaller, so I just start Adpro (takes less than 1 sec to
load) convert it, then quit the program to free up memory. Can you
imagen how long this would take on a Mac? FOREVER, that's how long.
Well at least a lot longer than Adpro.

Hell, I can't do anything if I want to run Kai's power tools, I may as go to sleep, or out to eat. Go figure.

See Mac only users get used to the slow responsiveness of their machines, then they go over to a Winodws based PC and think there system is fast. And you know what?, it is. But if they took the time to use an Amiga, they would get fed up with their Mac when they went back to it, and expected it to perform the same way as the Amiga.

The Mac's great just not in all areas. There are a still a few things lacking.

Hopefully, there will be a new Commodore, and more OS revisions, and then there will be more gaps in the awesomeness between OS's (of course in the Amiga's favor.) but it may not happen, but then again it may.

-Wight Wolfe-

Hopefully somone will come up with a realtime spell checker in tin, that can learn words. Then I wouldn't be such a bad speller, when I type so fast.

: the company that I ordered it from. (Or maybe it was Antic - it's been a
: while. :) The 130ST was, as the name suggests, a 128K ST. (And if there
: was a 260ST (I never saw one) it would have been 256K, therefore NOT
: identical to the 520ST...)

Well, I do not know much about other markets than the German one. In
germany,
Atari started out with a 520 ST with 512 kB of RAM. The 520 ST got
replaced by the 520 ST Plus, which was the same machine with 1 Mb of
memory. The successor was the 1040Stf, with integrated floopy and 1Mb;
the low end side saw for a very short period of time then the 260 ST,
which was the early 520 ST (wo. plus); the 260 ST got cancelled
relativelz fast. The 1040STf was rep;aced by the 1040STFM with TV
modulator, a 520 STFM followed much later for the British market. (the
520 STFM had 512kB AND floppy drive); the successor of all the above was
the Ste, which appeared first in form of a 1040 Ste (1 Mb) and later
(again for the british) a 520 Ste; 2080 Ste were produced in extremely
low quantities that showed up somewhere in Jugoslavia at the beginning of
the 90s. The top line consisted of the Mega ST 2, and the Mega ST 4,
which got a younger brother, The Mega ST 1. It was replaced by the Mega
STE. The new new topline held the TT, minimum 2 Mb. And then there was
teh Stacy and a 1Mb St Book on sale (in vetry low quatities) and now the
Falcon.

The 130 ST would not have made sense, because
a) TOS needs at least 128 kB RAM to run
b) TOS/GEM in the very early Atariages was not delivered in ROM, but on disk.
TOS 1.0 held 192 kB of ROM. it wouldn't even have fitted into RAM.
So, you woudn't even be able to run the operating system on the machine.
IMO, there has never been a ST or ST compatible model with less than 512
kB of RAM.

There existed, however, a 130 XE that looked like a ST (but with smaller
keyboard). Maybe the advertisers confused the ST with the XE? Are you
sure yoy don't have a 130 XE?

Regards,

Alfred

Well, hopefully to someones interest, I put togheter a "little"
test to show what, at least *I*, regard as a suitable multitasking
environment.

Currently I'm working on several projects wich have "leaping-right-
for-me-jumping-up-and-down-while-trying-not-to-look-stupid" deadlines.
With this in mind it's quite usefull to be able to do several tasks
at once.

1. My first project involves a VistaPro (fractal landscape-generation)
render of about 450 high quality (768x576 262K colors) and highly
detailed frames of a Matterhorn flyby....

2. My second task is a Lightwave (ever heard of this one?) raytracing
(with real raytracing - multi-object reflection, refraction etc.).
This was a single frame 1900x1340 24bit with lens flare and motion
blur.... I use a 52mb hd for virtual memory so I have plenty of
"ram" left (VMem wich is very, very fast). Gave this a "goahed" too..

The system as a whole is not showing much strain by the heavy
computing in the background - the hd's are working as fast as normal
and screen handling and auto-scrolling is as fast as ever (I use a
1500x1200 virtual screen on a 800x600 5-bit 86Hz interlaced WB).

3. My third project is writing an article for a local fitness-centre
on the pro and cons of high-impact workout.
For this I use Final Writer promoted to a Piccolo 24bit gfx-card
wich has a seperate monitor connected (1024x768x 60Hz 8bit).

I have a picture suitable for this article stored on the Emplant/Mac
so I execute the emulation and boot the Mac. The expected slowdown
of the emulation is apparent, but not of any annoyance...
I load PhotoShop, convert the 24bit image to 8bits and export it to
the Amiga, all in a matter of a few seconds. The emulation is also
run through the Piccolo on a 800x600x8 screen.

4. As a favour for my boss, I also need to fetch the latest Internet
gossip using his USR Courier (14.4bps) and NComm.
This is now running for itselves and scrolling every downloaded
message in the background. While I'm at it I also download an
AGA animation wich I accidently-brutely-deleted a while back,
the intro of the PC-game DogFight.

Now, I'm getting too serious here.
I'll try a game of chess (UChess that is - one of the finest
chess-game *ever* made for a computer) wich is opened on a native

Amiga-screen in 640x480x8 60Hz.
After a few moves my silicon opponent is really into thinking.
With all this CPU intensive tasks in mind, looking 4-5000 moves
ahed takes it's toll on time...
So I'll play another game, like, the realtime texture-mapped
Legends Of Valor. It's not fast at the moment but it's quite
playable and I'm able to drag and flip all the screens around
while moving about inside the game.
To free additional chipmem, I reduce the WB to 800x600.
Another game needs testing in this enviroment - Megaball wich
is a Archnoid style arcade in 8bit color. It plays without a glitch.

The Lightwave render is finished so I quit the program freeing
quite a bit of memory.. The DogFight intro is downloaded so I
load my "guru" program Directory Opus. Here I unarchive the 2.5mb
lha file and use Biganim, with a taskpri of 20, wich now plays the
anim (320x240x8) at about 35fps (from harddisk)..
At the same time I load another anim, this time Eveanim with
accompaning 8bit sound. This is a romantic story of two butterflies
raytraced in "old" 4096 color Ham. It still looks great though, and
plays quite smooth (from harddisk). I notice a marked fps rise once
the DogFight anim is finished with it's business and Eveanim is now
looping. The sound is glitching now and then because of the games
wich are not very system friendly and so I quit Megaball wich is
just making a lot of noise.

The Lightwave picture needs a little aftertouch so my next step is
to load TV-Paint onto the Piccolo-screen and apply some additional
effects.
I just got hold of the One Stop Music Shop wich is infact an Emu
Proteus Soundengine synth piggybacked onto a ZorroII card for the
Amiga. I start Qbase from the Emplant/Mac, load a MIDI-file and
play a delightful tune in full 32-pholyphony.
I'm getting real low on chipmem so I quit Eveanim and walk around
for a while in Legends Of Valor....

Another game draws my attention - Hired Guns. It's not a 3D tex-
mapped game but serves as a good indication of the capability of
the system at this time with it's many blitter opperations.
This game does not multitasks in the sense that I can flip back
to the WB or other programs at any time, but rather leaves the
game resident in memory when you choose "jump" to the WB.
(This has raised some speculation on whether the game uses complete
taskswitching and halting the rest of the system while playing.
This dosen't seem to be the case. My still on-going Vistapro render
is without shadow of a doubt commencing at pace...:-))

Too much game-talk? Ok. I put the hd's (I have three of them) to
a >nil-string search (even though they are SCSI-II's it's going to
take them a while to go through 15000 files).
I finish the rest of the article and proceed with the printing wich

with the HP4M (without postscript) does inflict some undesirable
effect on the CPU.
A frightening sound from LegendOV tears me back to the game world -
I've been killed.... It obviously dosen't multitask verry well -
when I moved the mousepointer around the other apps, LegendOV
followed the moves in the background.

As a final test I quit Legends and choose to restructure/resort
a large database using DBase 4, optimize one of the hd's, calculate
every prime numbers up to 50000, running a realtime Lorentz equation
pendle and finally, running Simcity 2000 on the Emplant/Mac (and yes,
it does multitask with QBase although the sounds are not very present).

Cheers....

PS. I forgot to tell you about the 24bit copper WB backdrop I've
been flipping around all the time....

Actually, QuickTime doesn't seem to screw up sounds unless you do something bad like play pre-2.0 QuickTime from a CD-ROM on a PowerMac (cough, choke, gag, drop sound, static, crackle, jitter jitter -- next frame! etc.) But I've finally seen QuickTime 2.0 play some video that was apparently recorded _with_ QuickTime 2.0 (important, since 2.0 seems to do nothing at all for previously recorded QuickTime), and it is definitely an improvement. I bought that new Sarah McLachlan multimedia Mac/Windows CRROM/Album thing, which comes with QT 2.0, and it plays smoother video from a CD than we've been getting from the hard drive -- at 240 * 180, I think the CD is getting 15 fps fairly reliably, as opposed to maybe 8-10 fps and dragging down to 4-5 fps when the camera moves. There's more artifacting; the effective resolution is probably about 120 * 90 plus a lot of semi-random noise that kind of looks like detail when things are moving, but this is still pretty good for 300k/sec as compared to, what, 2 or 3 times that for the hard drive?

QuickTime is a Good Thing. It's no general substitute for a fast, fixed-high-resolution animation format, but then ANIM is no substitute for QuickTime as an instant-video-on-your-desktop format either. It _is_ really cool and useful to be able to plug your VCR into the back of an AV Mac, grab several minutes of video, and then (after 2 hours or so of Dead Mac compression time) be able to play it back in a window with synchronized sound and/or build it into a multimedia document or edit it together with other bits of video, etc. Yes, the quality would have to improve by 500% to reach mediocre VHS levels, and I assume that if I shovelled a healthy pile of money into this A4000 I could do the same sort of thing with much better quality, but that's sort of irrelevant - QuickTime is cheap, it's here now, and everyone has it.

While I'm saying nice Mac things, I really like working with HyperCard. Especially the nicely integrated command line :) Now if only the Mac desktop was like that...

No, there wasn't, for Atari were unable to shrink the OS into 192KBytes at
first and thus _never_ shipped 680x0 machines with less than half a meg.

Synchronised audio support on the Amiga is very sadly lacking. It lags
behind what is available on competing platforms. The real shame is that
the Amiga is *ideal* for the sort of things that PC's and Mac's are trying
to do.

>>The Amiga doesn't screw up with frame acurate sounds, QT does.

You are comparing apples and oranges here. Beyond something like a
Vlab Motion, which can capture and play back a piece of digital video
with synchronised audio, there is very little available for the Amiga.
Moviesetter files don't count -- they are further down the evolutionary
chain, although still effective for some things.

>Actually, QuickTime doesn't seem to screw up sounds unless you do
>something bad like play pre-2.0 QuickTime from a CD-ROM on a PowerMac
>(cough, choke, gag, drop sound, static, crackle, jitter jitter --

I can make QT misbehave if I try something silly like playing a QT movie
with millions of colors on a MacIIx with 8 megs of memory, with VM enabled,
in 256 color mode.

I consider this a failing of the hardware, not QT itself. Try playing
an AGA animation on a ECS Amiga, and see how far you get.

If you can find it, check out the QT movie "Assimilation". It's on the
Arple Partner Edition October CDROM set. It's a movie trailer that is
a couple of minutes long, 42 megabytes in size. Very impressive stuff.

>QuickTime is cheap, it's here now, and everyone has it.

I wanted to edit this section "to save bandwidth", but I had to leave
it in so that I can say "amen".

QT is just the sort of thing that should have been done for the Amiga.
It will play on just about any Mac, though only useably on the better
equipped systems. The A/V Mac configuration is something that the Amiga
should have -- standard video and audio inputs, in addition to the video
and audio outs that the Amiga pioneered.

Frankly, I would love to see QT development tools on the Amiga. With
a suitable graphics card (Spectrum24, etc.), the Amiga could be a very
nice platform for creating and editing QT movies. As it is, I will probably
buy a lot of ram, and try to use an Emplant to do the same thing.

QT 2.0 is making a very real bid to becoming a multiplatform standard
for digital video. Apple will sell you the developer's kit for very little
($75.00 I believe) with sample code for the PC, Vax and Sun platforms. It
really saddens me to see the Amiga miss out on something this neat --
especially with QTVR just around the corner (in fact, already out in a
commercial product -- STNG Technical Manual on CDROM).

Why would Atari get back into the computer market? The only practical thing they could do is make PowerPCs or Intel clones. Coming out w/a new platform would be *very* stupid. People don't want new, better, platforms. They want their PCs w/20,000 games. Just look how well the PowerMacs are doing. How well do you think an Atari (who's been out of it since the early 90s) can fare against Intel/Microsoft dominance? Atari is making a *BIG* mistake if they come into the computer market again w/a line of computers. Even if they make clones, who would want them? There are so many reputable clone makers out there (Zeos, Dell, Gateway, Quantex, Alr, Compaq, Acer), why would you WANT an Atari?

fred

They've only been "out of it" for maybe a year. And I think that the current "Gimme what my neighbors have, even if it's trash" trend will eventually dissapate. Sur,e it might take the toppling of Intel & Microsloth (Might as well throw in Apple there too) but I think it will happen.

Who knows? If there is a away to botch things even more than they have already been botched, as far as promoting A/UX and improving it, I'm sure Apple will find it. If anyone at Intel gets fired over the handling of the Pentium bug, I expect Apple to hire them and put them in charge of A/UX.

Sadly, a Pentium 90 running OS/2 Warp, Linux or Windows `95 with 16 megs ram , gigabyte HD and SVGA card capable of 1024x768x256 colours or 24 bit at 800x600 no longer constitutes trash. Given that the price is so reasonable, PCs now represent a _very_ good buy. The days are long gone where you had the ST and Amiga thrashing the hell out of 12mHz 286s with EGA gfx and no sound capability.

I like my Amiga and prefer it to using a PC but when the time comes that I need more power, I'll be buying a Pentium.

> Yes but not an Amiga as much as on the MAC. I can't even compress that
> much stuff at once on the MAC.

If the machine is actually -faster- while compressing 27 items at once, something is wrong with the CPU - allocation method. Having used an Amiga for years, I can tell you that adding another compression to one already going will halve the speed of what would normally be attained (ie it really does slow down), but the -USER- interface (ie moving the mouse, swapping tasks) doesn't slow, period. Compressing 27 things at once, aside from a nice test of re-entrancy in LHA, is silly when you'll just have to open loads of CLIs (or multiple RUNs) to get the thing going, and it will increase overhead (not to mention T: (ie RAM:t) usage).

> Emplant is a software emulation of sorts, but not as far gone, as
> emulating a whole new chipset. My 040/25 Amiga is just as fast as my
> friends Centris 650 040/25. What do you say about that? Seems to be a
> bit better than Softwindows, don't you think?

Please send me Binhex'd (or UUE'd) Speedometer 4.0 results for that machine. Or post your results that you get for CPU, Graphics, Disk, and Total. Preferably, do both. Thanks!

> I was asking him to list the ones that are slow, Adpro is faster than
> Photoshop on the same CPU, ImageFX is nice also. Paint programs, are

Sure, but it does 1/2 as much. ADPRO is no Photoshop. And ADPRO is slow when you stack it against a modern Mac, like a PPC Mac, or even a DSP-using 040 Mac. Lack of advancement in Amiga processor technology is hurting the Amiga high end market. (Rather, what's left of it is being hurt.)

> great, modem programs are without a doubt more functional and more
> responsive on an Amiga than a comparativily equipped Mac.

Modem programs, perhaps. I use modem programs on the Mac infrequently, whereas I use TCP/IP programs (Fetch, Newsreader) daily. The Mac implementations of Internet software have no equal.

> Word-Processors are quick also, I just couldn't see how he could say that
> modern Amiga program were slower than a Mac app. If anything they are
> the same or a little faster on comparative processors.

WRT WPs, I strongly disagree. Amiga WPs, lacking so many features and being so slow in doing so much, are a -pain- to use, especially when one

is used to the speed and grace of Word 5.1/Mac or 6.0/PC.

> I am not saying that the Mac is a useless piece of sh*t, I am just saying
> that the Amiga is not as bad as some of you think it is. I use Macs alot

It's not that we think it's -bad-, just that it's slow and a bit outdated
by today's standards, and it has no software development to speak of. And
the fastest processor C= used to make (040@25) is -really- slow and
-really- overpriced.

> and I like alot of things about them. There are just a few things about
> them that aren't up to par yet. The major thing is the multi-tasking,
> the next is the anim play back. QT is nice for previews but I couldn't
> output to tape on the Mac like I do on the Amiga.

Multitasking I'll grant you. 5 to 10 second Amiga ANIMs that I saw never
impressed me like QT2.0 does. I think it mostly has to do with the fact
that QT videos are everywhere, QT videos have sound thrown in as well, and
it all -works- right, the first time, every time. Schwartz's anims on the
Amiga have nothing on QT, and I never saw huge ANIM7/ANIM32 anims for the
Amiga aside from tiny 5-10 second demos. Unimpressive and huge is my
recollection.

>

> Mac at the same speed that I can do them on the Amiga.

This, I have to agree with. But with fast PPC 601/60 Macs going for $1299
new (8/250 setup), who cares? The machine is fast enough to throw
anything around.

> For instance, can you load Phtoshop and do something else while it loads?
> NO? Oh I'm sorry.

It loads very quickly on a modern machine. Most people complaining about
this are using old Macs. Photoshop 2.5 / 3.0 wasn't intended for old
Macs. It will run, but there comes a point when if you want performance
you need a modern machine.

> Also, there are many a time when I am on the modem and I

> imagen how long this would take on a Mac? FOREVER, that's how long.
> Well at least a lot longer than Adpro.

Considering a small application would probably do that on a Mac and
wouldn't swallow all of your memory like ADPRO does (yes, I know MAXMEM=
does it too) and is also free, I don't see the point.

> Hell, I can't do anything if I want to run Kai's power tools, I may as go
> to sleep, or out to eat. Go figure.

A programming decision. Not one that I agree with, but that isn't Apple's
fault. But yes, I do see this point.

Iron, iron, iron. Is that all anyone thinks about?

Well, my family needs a computer to do real work. Windows '96 (:-) doesn't even exist yet, I consider Linux a fun and useful Unix lovers OS, leaving only Warp or Windows 3.x running Windows applications for doing work with commercial tools.

I personally cannot stand most of the Windows software. I do not like the human interfaces and the complexity of running and maintaining the system. Most of the really cheap machines I have seen come with really crappy monitors that give me headaches after 30 minutes. Windows font handling is the pits (IMHO...)

I like most persons have difficultly getting through the advertisements for $2,000 pentium machines. But I dislike the >software< so all that fancy cheap hardware does not do me much good.

Even when (not if) I get another computer, my trustly STe will remain next to my synths faithfully (and effectively!!) doing its job.

Sadly, I own a 486/66 with the above specs plus a CD Rom. I got "good"
components instead of "cheap" ones - cost about $4500. Broke more in its
first week then my Falcon in a year. Still doesn't work up to its full
potential. I get out of memory errors given even the slightest provocation.
I crash running software that is supposed to be stable. My CD Rom doesn't
work right for no real reason. my soundcard support is flakey, my software
costs too much. Yes, I use it all the time instead of my Falcon, because
I dedicated my Falcon to MIDI stuff, where its best. But if I could get
something with the same raw Horsepower as my PC in an Atari Architecture,
it'd run rings around the PC...

I second this one. If Atari were to build new computers, they surely
should be PowerPCs (PReP/PReP+/AIM). And who'd buy them from Atari?
IMHO they'd be better off if they finally developed an entierly new OS
(software compatible to TOS) and try selling this one. But if they don't
want to come back, they should publish the sources to TOS, IMHO.

Well, hopefully to someones interest, I put togheter a "little"
test to show what, at least *I*, regard as a suitable multitasking
environment.

Currently I'm working on several projects wich have "leaping-right-
for-me-jumping-up-and-down-while-trying-not-to-look-stupid" deadlines.
With this in mind it's quite usefull to be able to do several tasks
at once.

1. My first project involves a VistaPro (fractal landscape-generation)
render of about 450 high quality (768x576 262K colors) and highly
detailed frames of a Matterhorn flyby....

2. My second task is a Lightwave (ever heard of this one?) raytracing
(with real raytracing - multi-object reflection, refraction etc.).
This was a single frame 1900x1340 24bit with lens flare and motion
blur.... I use a 52mb hd for virtual memory so I have plenty of
"ram" left (VMem wich is very, very fast). Gave this a "goahed" too..

The system as a whole is not showing much strain by the heavy
computing in the background - the hd's are working as fast as normal
and screen handling and auto-scrolling is as fast as ever (I use a
1500x1200 virtual screen on a 800x600 5-bit 86Hz interlaced WB).

3. My third project is writing an article for a local fitness-centre
on the pro and cons of high-impact workout.
For this I use Final Writer promoted to a Piccolo 24bit gfx-card
wich has a seperate monitor connected (1024x768x 60Hz 8bit).

I have a picture suitable for this article stored on the Emplant/Mac
so I execute the emulation and boot the Mac. The expected slowdown
of the emulation is apparent, but not of any annoyance...
I load PhotoShop, convert the 24bit image to 8bits and export it to
the Amiga, all in a matter of a few seconds. The emulation is also
run through the Piccolo on a 800x600x8 screen.

4. As a favour for my boss, I also need to fetch the latest Internet
gossip using his USR Courier (14.4bps) and NComm.
This is now running for itselves and scrolling every downloaded
message in the background. While I'm at it I also download an
AGA animation wich I accidently-brutely-deleted a while back,
the intro of the PC-game DogFight.

Now, I'm getting too serious here.
I'll try a game of chess (UChess that is - one of the finest
chess-game *ever* made for a computer) wich is opened on a native

Amiga-screen in 640x480x8 60Hz.
After a few moves my silicon opponent is really into thinking.
With all this CPU intensive tasks in mind, looking 4-5000 moves
ahed takes it's toll on time...
So I'll play another game, like, the realtime texture-mapped
Legends Of Valor. It's not fast at the moment but it's quite
playable and I'm able to drag and flip all the screens around
while moving about inside the game.
To free additional chipmem, I reduce the WB to 800x600.
Another game needs testing in this enviroment - Megaball wich
is a Archnoid style arcade in 8bit color. It plays without a glitch.

The Lightwave render is finished so I quit the program freeing
quite a bit of memory.. The DogFight intro is downloaded so I
load my "guru" program Directory Opus. Here I unarchive the 2.5mb
lha file and use Biganim, with a taskpri of 20, wich now plays the
anim (320x240x8) at about 35fps (from harddisk)..
At the same time I load another anim, this time Eveanim with
accompaning 8bit sound. This is a romantic story of two butterflies
raytraced in "old" 4096 color Ham. It still looks great though, and
plays quite smooth (from harddisk). I notice a marked fps rise once
the DogFight anim is finished with it's business and Eveanim is now
looping. The sound is glitching now and then because of the games
wich are not very system friendly and so I quit Megaball wich is
just making a lot of noise.

The Lightwave picture needs a little aftertouch so my next step is
to load TV-Paint onto the Piccolo-screen and apply some additional
effects.
I just got hold of the One Stop Music Shop wich is infact an Emu
Proteus Soundengine synth piggybacked onto a ZorroII card for the
Amiga. I start Qbase from the Emplant/Mac, load a MIDI-file and
play a delightful tune in full 32-pholyphony.
I'm getting real low on chipmem so I quit Eveanim and walk around
for a while in Legends Of Valor....

Another game draws my attention - Hired Guns. It's not a 3D tex-
mapped game but serves as a good indication of the capability of
the system at this time with it's many blitter opperations.
This game does not multitasks in the sense that I can flip back
to the WB or other programs at any time, but rather leaves the
game resident in memory when you choose "jump" to the WB.
(This has raised some speculation on whether the game uses complete
taskswitching and halting the rest of the system while playing.
This dosen't seem to be the case. My still on-going Vistapro render
is without shadow of a doubt commencing at pace...:-))

Too much game-talk? Ok. I put the hd's (I have three of them) to
a >nil-string search (even though they are SCSI-II's it's going to
take them a while to go through 15000 files).
I finish the rest of the article and proceed with the printing wich

with the HP4M (without postscript) does inflict some undesirable
effect on the CPU.
A frightening sound from LegendOV tears me back to the game world -
I've been killed.... It obviously dosen't multitask verry well -
when I moved the mousepointer around the other apps, LegendOV
followed the moves in the background.

As a final test I quit Legends and choose to restructure/resort
a large database using DBase 4, optimize one of the hd's, calculate
every prime numbers up to 50000, running a realtime Lorentz equation
pendle and finally, running Simcity 2000 on the Emplant/Mac (and yes
it does multitask with QBase although the sounds are not very present)

Cheers....

PS. I forgot to tell you about the 24bit copper WB backdrop I've
been flipping around all the time....

Thats funny.. My $1,199.00 Performa 550 with cdrom works like a charm. came with a bundle of software as well as cdrom titles. Works flawlessly. No configuration of the cdrom with software. True plug and play...

Can't wait for the PCI upgrade next summer..

So whats wrong with your pc?

I don't understand how you could spend $4500 on a 486/66. You must have
bought it a while ago.

Today, you can get a Dell (if you call this cheap, you're
insane,it's only cheap compared to OVERPRICED brands like IBM and Compaq)
Pentium 90, 16 megs ram, 1 gig hd, 15" monitor, 128 bit #9 graphics card
w/4 megs ram, Nec 3x cdrom all for $3600 nowadays.

i'm curious to what your setup is, and when you bought it.

fred

I bought it in June. I don't have the recript handy... I didn't buy this
as a put together machine. I bought the components separately and got
everything as good quality stuff. SCSI II controller (no IDE),
NEC CDROM, COnner Tape Backup, We actually bought Dos & Windows, etc.
The receipt was long, let me tell you...

: doesn't have the software, and with 4-5 new next generation systems
: entering the video game war, the Jag, it seems, will be left behind. I
: just don't think Atari has the money or the developer support that 3DO

You've *got* to be kidding. Trip's bank accounts are dropping faster than
THDO's stock prices! An article in Time magaine recently stated that if 3DO
doesn't start turning a profit -- and soon -- they'll be filing for
bankrupsy within 7 months. This is a company with more money than Atari,
who just bled $90 mil from Sega? And as to the question of developer
support, most of those developers on the 3DO are affecting a "wait and see"
attitude, and some are dropping out of the picture, either due to poor sales
of the 3DO or Trip's royalty fee hike for developers which doubled the
royalty fees. On the other hand, the Jaguar's market is expanding rapidly,
the software is starting to flow more rapidly (4 games were release this
weekend alone), and Atari has the funding to launch an aggressive marketing
campaign, which they will be doing in January. (They've already been
advertising on television -- mostly cable in the US -- but that will be
expanded) And finally, as to the question of next generation systemns --
they're only available in Japan rtight now, and they cost an arm, a leg, and
several choice organs to buy in the US. The Saturn is said to be a
disappointment to those who were expecting more, and the PSX is expensive.
U64 isn't even close to being out yet.

: does. Another advantage of 3DO is that it is an expandable standard,
: produced by Samsung, Sanyo, Panasonic, Goldstar, and Creative Labs. 3DO

So far only Creative Labs (3DO Blaster card for the PC), Panasonic and
Goldstar have any of these units out. Samsung don't seem to be doing
anything with them, and last I heard, Sanyo dropped out.

: will be releasing an upgrade module in the near future that is *backward*
: compatible with all current software, unlike Sega's Saturn & 32X. The
: games for 3DO right now are better than *anything* else, IMO. Road Rash,

M2 will suffer from the same problems as the 32x: A 64 bit system plugged
in through a 32-bit bus, just like 32x is a 32-bit system plugged in through
a 16-bit bus. Unless the M2 is totally independand of the 3DO's hardware,
the bottleneck will be a crippling factor in the M2's speed.

: The Need for Speed are two excellent racing games, John Madden Footbal,
: FIFA International Soccer (wow!!) are also two very good sports games,
: with NHL '95 coming soon from EA Sports. Then there is Samurai Shodown,
: Super Street Fighter 2 Turbo with almost 1:1 arcade conversion quality.
: DOOM & DOOM II are being ported by Art Data for the 3DO, including a few
: FMV clips to give DOOM some sort of plot & story line. Supposedly, Art
: Data is redoing the graphics to take advantage of the 3DO.

As far as I'm concerned, fullmotion video is utter crap, and only detracts
from a game's enjoyability.

: As far as the 32X, its a quick fix, but will quickly fade to the 32/64 bit
: systems available now & in the future, IMO.

>bought it a while ago.

Last year or early this year, I'd guess. The price tag of 486s is falling
steadily since September or so.

>Today, you can get a Dell (if you call this cheap, you're
>insane,it's only cheap compared to OVERPRICED brands like IBM and Compaq)
>Pentium 90, 16 megs ram, 1 gig hd, 15" monitor, 128 bit #9 graphics card
>w/4 megs ram, Nec 3x cdrom all for $3600 nowadays.

No SCSI CD-ROM and HDD, no good monitor, and I am pretty sure the 128 bits
graphics board is not included. To set it straight:

A P90 8 megs 256 KB 2nd 540 meg HDD costs 2.899,- DMs (1800 $) currently
and this machine only has a 1 meg gfx board, not to mention that if you're
going to do some float maths.... :->.

Sony 15sf 999,- DMs (a good 15", 17" are more expensive, of course)
ATI Graphics Ultra Pro 4 megs 899,- DMs (I want to use OS/2, so it's got
to be an ATI board)
16 megs 949,- DMs
1 GB HDD 949,- DMs
Adaptec PCI 578,- DMs
Asus PCI/P90 board 978,- DMs

That's 3300 US$s, so far, and still the machine doesn't work. Case,
keyboard, serial I/O, CD-ROM etc. add to these costs. I'd estimate 4000
Dollars or more is the price of the complete system.

The 260ST came after the 520ST and had half a meg of RAM (the 520+ had 1
meg), don't let the names of the machines confuse you. i still have the
magazines here to prove it.

How does this affect the 3do system? 3do does not make the console, Panasonic
and GoldStar do.. As for the poor sales of the 3do, hopel will do better soon.
However the Jagflop has done poorly compared to the 3do. Atari may no make it
either and they are on more shaky ground than 3do. Atari's Jagflop has been an
utter failure, flop and pathetic. Lots of people buying Nintendos today at my
local Wal-Mart..

As for Atari to launch a Marketing campaign, get real. I have been hearing this
year after year. Atari is not capable of doing so..

As for the PSX, Sony is supposely to take a $100 loss on each unit they sell
and make it up in cd sales.. So expect to see a $300 playstation on your door
steps soon. looked awesome on tv recently..

Sounds like they're both sucking wind. All it'll take is one more new heavily-promoted console next year (and we might get 2 or 3 of them, from the sound of it), and even the people who might have bought this stuff will finally conclude (correctly) that this entire post-Sega console niche is an unstable mess and by far the worst available investment in consumer electronics today. This week, one platform pulls a little ahead, next week, it falls back into the mire and another platform pulls a little ahead and its tiny handful of games grows a little, only to be knocked into limbo when platform #3 suddenly sells a few dozen units and all the developers eagerly scurry over to it, and so on, and so on. All these platforms will be as dead as DCC and MiniDisc once consumers wake up, and I think a lot of them are already awake, happily playing with their SNES units and not looking to buy anything new in 1995 just because some ad campaign shows them some 0.5 nanosecond screenshots and tells them it's "cool".

>As for the PSX, Sony is supposely to take a $100 loss on each unit they sell
>and make it up in cd sales..

Isn't this illegal in North America? (If it isn't, then SNES units would have been $1.99 instead of $99 all along, right?) I thought you couldn't deliberately flood a market with products dumped at a loss, and I thought this explained those odd deals where you buy a cellular phone for $150 and can then get a $149 "rebate".

>500,000 sold to date..

3DO units? To whom? Where? This platform still fails the "no ten-year-old kids have heard of it" test, so I can't believe it's doing well in any sense of the word. But I suppose even 500,000 units is an abject failure in this low-margin market (aren't there a few hundred million SNES boxes out there?)

The PSX is a nice machine ... I'll admit that. But it's still too
expensive. You won't be seeing it on your doorstep "soon" because it's
going to remain in Japan for some time yet -- at least until late spring,
possibly into summer, before it gets to North America.

: 500,000 sold to date..

Worldwide. Care to compare against figures sold in the US alone? I'm
wagering you won't like the figures -- the _real_ ones -- nearly as much.
(The Jaguar, if you recall, it's officially available worldwide)

: >M2 will suffer from the same problems as the 32x: A 64 bit system plugged

In Europe you *CAN* buy a Jaguar; that is, if you know abou it, if you
are calling shops around you will at some point eventually get hold of a
Jaguar - most possibly in a small shop which to find you ned a map.
Advertising and marketing is non-existing. You are hearing about it
ONLY in atari magazines that deal with falcons and STs and maybe some
games magazines. They are selling- but with a 0.0x% market share.
With the 3DO it is, however, no way better than with teh Jaguar over here
Other copnsoles haven' appeared at all.
Well, the 3DO and the Jag - a battle between losers?

Very true. If you can wait on a console for awhile, than do so. I am waiting
for the Playstation to come out before I decide. I wonder if International
Soccer will come out for the Playstation. As far as I am concern, the Jagflop
is dead. But may pick one up to add to my growing collection of classics..

The Jagflop has been an utter failure. With thirteen games and 200,000 in
sales in the last two Christmas seasons. As for 3do, sales have been better
with 500,000 units sold. I am still not sure if it will make it with the
PlayStation on the horizon. As for EGM, no I don't work for them. What do you
think EGM should say about the Jagflop? Are you angry that a publication
thinks the Jagflop is an utter nonsene and not going anywere..

I thought it was illegal for a manufacturer to sell below cost; I'm sure
it's OK for a retailer (hence the term "loss leaders").

>However, Wal-Mart sells many items below cost.

Yeah, the 500 "price sensitive" items, as opposed to the other 30,000
items that people only think are cheaper :) Since we've got Wal-Mart in
Canada now, I can't believe people fall for that "Wal-Mart is cheaper"
nonsense. I almost choked when I saw that they were selling all their
music CDs for $21.73 ($15 US), when any sane record store in town is
selling them for $13-$18 ($9-$13 US). And floppy disks are overpriced,
and computers are overpriced, and basically everything _I_ would buy seems
to be overpriced. On the bright side, Wal-Mart Canada doesn't seem to be
enforcing the weird moral dictates of Wal-Mart USA; up here, it's OK to
buy the Nirvana-album-with-plastic-fetuses-on-it.

THDO stock is at an alltime low right now ... this does not by any means
indicate a thriving cvompany who's selling units faster than they can make
them. And if you think otherwise, you're even more deluded then I thought
(which would take a considerable amount of doing). And 3DO sales in the US
as of October (sorry, don't have any newer figures) was 75,000 in total,
compared to the JAg's 250,000 at the same period (Source: Wall Street
Journal). And there are 17 games, not 13. Which pretty much serves to
prove how misinformed and sorrily mistaken you are. As for EGM, they're
biased claptrap whose comments on the Jaguar go against *every*single*other*
gaming publication.

: Yes, and so has past firms who have done Atari's marketing.

Atari's past firms were small ad agencies who were utterly hopeless.
Edelman is one of the US's largest advertising agencies. There's a world
of difference.

: But will still be here. Spring is only three months away. Not much time for
: Atari to launch a counter attack..

Nothing is going to stop new tech from emerging... that's the way things go;
new machines overshadow older ones. However I believe the Jaguar stands a
good chance of overshadowing new consoles by sheer dint of numbers, if not
technology -- and the Jag has better technology than the Saturn,
guaranteed. In addition, the Jag has a lot more known developers than the
other platforms in Japan -- sure, they've got lots of japanese developers,
but having seen the list of PSX developers from the PSX FAQ, I was able to
recognise maybe three. On the Jag I could probably tell you what at least
75 of them are.

: Lets see what the figures are in the US. Have any truthful ones?

See above.

: You have no idea what the performance will be like? It's called wait and see,
: da!!

Nobody has any idea what the performance will be like -- *including you*.
But since the M2 will be plugging in through a 32-bit bus, it doesn't matter
HOW good they make the machine ... it's STILL going to have that 32-bit
bottleneck, and that is going to hamper its performance in a significant
way.

Oh gee, I was off by four games. But most of these games were not available
nationwide until after Christmas..

As for the sales figure of the Jagflop, only 105,000 were sold as of
October(Source:Atari's press release..)

As for stock prices, I can say that Atari is dead. Yes 3do is having a
difficult time, But Atari is in worse shape.

But, you don't know that..The PowerMac 7100 is a 64 bit machine versus a Quadra 630 is a 32 bit one. A Q630 with a PowerPC processor board exceeds the performance of a 7100 in some tests.

I also question if the Jagflop is a true 64 bit console. I have done the math and the numbers do not add up...

Maybe it's not officially available because Atari has wisely decided to
concentrate its resources on one market? As you well know, they cannot afford
to be blasting every country in the world with ads 24 hours per day, so why not
focus where they have a good chance? I rarely watch TV, and I've even seen
a few Jag ads...

>The market has decided that the Jagflop is a utter flop. Get over it..

The universe has decided that you are an utter moron. Get over it. (And we
know your penis is an utter flop! stop telling us this!)

Please, do the world a favour and sell that Precious Mac of yours and buy
yourself a clue. Ever heard of progressive marketing? It's where a company
introduces a product into the market in only a few areas so that they can
sell units to make more money to be able to introduce it to still more
markets, where they make more money and again expand their market, and so
on. And that is what Atari is doing. That, in fact, is what a *lot* of
companies do -- most company also do test marketing beforehand, introducing
their product to a small area first before mass marketing it.

You havn't a bloody clue. Get over it.

sinclair@ins.infonet.net wrote:
: Oh gee, I was off by four games. But most of these games were not available
: nationwide until after Christmas..

All of them were available before Christmas, with Bubsy and Zool II making
it in just under the wire by arriving in stores on the 24th.

: As for the sales figure of the Jagflop, only 105,000 were sold as of
: October(Source:Atari's press release..)

Funny, but in spite of the fact that I collect every single Atari press
release concerning the Jag (above and beyond other information I can gather)
I seem to have missed this suprious report. How, oh, how did this happen?
You have a very active imagination.

: As for stock prices, I can say that Atari is dead. Yes 3do is having a
: difficult time, But Atari is in worse shape.

Oh? Funny ... Atari stock prices rose from the ashes of $0.50/share not
more than two years ago to settle in and around $4 right now -- an 800%
increase on average in that period of time. By the same token, THDO's
stocks have been steadily dropping... and dropping ... and right now sit at
~$9. A far cry from its IPO.

: Not realy.. But, the Tramiels make the final decisions. As for their marketing
: or lack of one, I must of missed it.

Atari okays the final cits of commercials and ads... they do not participate
in the campaigns themselves other than to fund them. And yes... you miss a
lot of things, not the least of which are the facts.

: But, you don't know that..The PowerMac 7100 is a 64 bit machine versus a Quadra
: 630 is a 32 bit one. A Q630 with a PowerPC processor board exceeds the
: performance of a 7100 in some tests.

There are a lot of variables to deal with. I could just as easily say that
a 386 SX-20 is faster than a 486 DX-66 if I was comparing a 386 equipped
with a Viper graphics card to a 486 equipped with a low-end VGA card in
terms of graphics. Please, don't spout off selected tests designed to show
superiority in departments which hold no relevance to _real_ tests. Hey,
the Falcon can clear a TrueColour screen in under one VBI and a high-end PC
with a fancy video card can't! (See?)

: I also question if the Jagflop is a true 64 bit console. I have done the math
: and the numbers do not add up...

Apparently you've been nodding off in elementary math class. 64-bit data
path, 64-bit GPU, 64-bit object processor, 32-bit DSP, 16-bit 68000 general
purpose processor. What part of "DO THE MATH!" didn't you understand?

>markets, where they make more money and again expand their market, and so
>on. And that is what Atari is doing.

Progressive marketing at the sluggish speed that Atari is doing it can't
possibly work in the videogame industry, where technology goes from "hot"
to "obsolete" to "dead in a dumpster" in about 2 years (unless it manages
to sell 50 million or so units, in which case it can extend the "obsolete
but still selling" phase for another couple of years--eg. SNES, Atari 2600)

>That, in fact, is what a *lot* of
>companies do -- most company also do test marketing beforehand, introducing
>their product to a small area first before mass marketing it.

"Test marketing"? For what, 2 years? :) I'm sure Atari is doing the best
they can with the resources they've got, but that doesn't mean that slowly
trickling unpromoted Jaguars into various corners of the globe is a
strategy that has a chance in hell of working (unless a miracle happens,
like meteors crushing the headquarters of the other 6 competitors).

Isn't that what you are doing? I do not own a 3do(I have a 2600, 7800 and 2
lynx's), but what I have seen, their numerous titles have put the Jagflop to
shame. Atari needs to reduce the price of their console to $150 and get them
in Wal-Mart if they want a chance.

Atari can only work at the pace which their funds allow them. To push
further means to risk losing money, and Atari can not do that, lest they
fold altogether. They have to take it one step at a time right now, and if
that means slowly introducing it into the market, then so be it. So far,
however, it has proven, if not a smashing success, then at least moderately
successful.

: "Test marketing"? For what, 2 years? :) I'm sure Atari is doing the best

The test market only lasted for approximately 4-5 months and existed in NEw
York and San Francisco. Once they expanded, the test market was no longer,
and the national rollout began. The Jaguars are being promoted -- check any
video gaming magaine, watch cable television, etc. I've seen Jaguar ads,
mostly on Fox (I rarely watch television, and as the ads are only in the US,
Fox is pretty well the only US station I watch ATM) but they also advertise
on MTV, CNN, CBS, NBC, ABC and a host of other cable US networks.

Sinflop whined:

> These games were not available at all locations. Most of these
> trekled in but not available nationwide.
^^^^^^^ ^^ ^^^ ^^^ ^^^^^^^^^ ^^^^^^^^^^

Sinflop, once again I have been convinced by your superior rhetoric, dazzling sentence structure and exemplary spelling. It is because of your illiterate, ill-informed, weasel-like attempts to defame the Jagaur that I decided to go out and buy one.

Frankly, I've been concerned about Atari's track record, too. I have to say that I've gotten more enjoyment for my money out of this game system than anything else (except maybe for my TV) that I've ever purchased.

In other words, if you've got a bone to pick with Atari, please pick up a dictionary, a thesaurus, and a clue before you sit down to write. If you attacked them solely on Atari's wishy-washy reputation over the last four years, I'd have to agree with you. If you attacked them on their delays in getting quality titles to the shelf, I'd have to agree with you. (However, with 3-4 titles sliding on to the shelves every week now, I'd say that they've bucked this trend...)

Instead, you make up fictional numbers and irrational arguments against a quality piece of hardware that you seem to fear for some reason. No one listens to you; everyone laughs at you. Why don't you spare yourself the embarassment you bring upon yourself every time you spew this kind of nonsense about the net?

I read your messages and I find myself wishing that you'd just shut up...I feel so much pity for you! Every time I see your name in the header, I think of the old adage: "It is better to remain silent and be thought a fool than to speak up and remove all doubt."

What puzzles me is that you own a Macintosh - most Mac owners I know can at least SPELL, for God's sake. Maybe you bought a Mac to compensate for some other, hypothetical inadequacy (impotence, or lack of a brain, perhaps...). How embarassing for the Mac crowd...

Anyway, to the original poster -

The Jag has a questionable future, but is doing well, in spite of Sinflop's ardent wishes to the contrary. I've had my doubts, but I love the system and I love the games so far, and I'm here for the ride. Since you can pick up a used one for under $175 (with tax), I

consider it to be a worthwhile investment. 3D0 is a good machine, too. I hope it succeeds. I, for one, can't afford one. I'm sticking with the Jag. My opinion: It's an awesome machine. Fact: It's a workhorse, at a bargain-basement price, and the games are finally starting to flow for it.

To Peter -

I have no specific quibble against you, but I do feel sorry for anyone who tries so hard to communicate ideas that are so very obviously wrong, and who seems to lack the basic langauge skills necessary to convey those ideas. The Jag is not a perfect machine. Why not start with something simple like that if you want to make a stand against the Jag? Simple subject, verb, predicate noun - it's not that tough...

The last time I heard the phrase "get over it" used more than three times in succession was in a third-grade classroom a few weeks ago. Seems like that is your substitute for a solid platform against the Jag...

JASON

ATARI HAS NOT CHANGED...AT ALL...GET OVER IT..

Atari's marketing of the Jagflop has been utter shambles. First, the console
lacks adequate distribution. In Iowa, the Jagflop is not available in
Wal_mart, K-Mart, BestBuy, Sears and countless Software Mall stores. Second,
games were very late in the comming. Last minute releases were a day or two
before Christmas at some locations. Third, the price is too high. The Jagflop
needs to be reduce to $150 inorder to have a chance. Make the profits in game
addons. Fourth, Atari's credibility is zero. The firm promised 50 games and the
cdrom unit before Christmas. The end result is that Atari screwed up by
delivering only 16 games and the cdrom unit is no were in sight.

I suggest you take off your blinders and smell the weed...it will do ya
wonders..

It ain't so.. Have a bad day? Well, I suppose I have done a favor for Atari. I might aquire a Jagflop to add to my collections of classics. But will wait for the fire sale. I could conceivably be at Atari's Warehouse when the bankrupsy auction is taking place.

: any of a hundred stores and buy one. And advertising in Canada is
: non-existant, too. And that's because *it isn't officially available
: here!*I Why would Atari waste money advertising somewhere where the machine
: isn't officially available? Please, pick up a few pointers on marketing
: before you drool on as though you have a clue.

Well, too bad. The Jaguar is in Germany officialy available, there is a
distribution contract being signed between Pagedown, a German company, and
Atari.
I do not know, how it is in the UK.
My point was to state, how the situation of sold Jaguars is in Austria
and Germany from the point of view of a customer. No more and no less.
Period.

Now, if you think you are the true marketing specialist, continue to
think so (well, of course you again confuse "marketing" with "advertising").
Some people think that if they can fly a flight simulator on a console or
PC, they are fighter pilots :-)).
I would suggest you take some time off your joystick and at least try to
work on yourself, especially on your arrogance and the way you
conduct yourself in course of discussions. Would improve your culture.
Honestly.

Regards,

Alfred

SIGH...

>It ain't so. A Jagflop is bad und is did an it dead.. I sh

Huh? What a forensic!

I think by now, Sinflop, anyone reading this thread has decided how much weight they should give your arguments. What do you think? Have you convinced them? "Don't buy a Jag because is bad is did an it dead.. I sh." Fantastic rhetoric. My mind boggles.

Sinflop's fantasy: ATARI has failed. They didn't get enough games out soon enough, they have failed in their marketing of the Jaguar (which was never actually a 64-bit system in the first place), and the Jaguar will be a curiosity in a few months. Did I get all that straight?

The reality: ATARI is enjoying moderate success with the Jaguar at this point in time, after a year of slow sales. Games have been slow in coming, and some are real duds. However, Iron Soldier is incredible and is unavailable for any other platform. ID themselves have publicly stated that the Jag version of DOOM is the best version for any platform. Alien vs. Predator has been met with universal praise and has been hailed as one of the first true "next generation games". All this attention has turned the heads of many gamers, and things are finally beginning to improve at Atari. Atari * has * lost a lot of critical lead time due to delays in software and hardware. No doubt about it. It is impossible to say how Atari will fare against the other "next generation" consoles until they arrive - as much as Sinflop would like to prestigitate, he can't even see the facts of today when they are right in front of his nose.

Sinflop, you are so much fun to flame. I think it's apparent to everyone that I am acknowledging both the good and the bad of the Jaguar system. You however, hold your one-sided diatribes against the Jaguar and we only stop long enough to laugh at you. We reply because you are a simpering dolt, and you are an awfully easy mark. I'm flaming now without remorse because SO many people (Atari "fanatics" and many, many other people) have told you how stupid you look and you don't seem to care. Fine, then. You've brought this upon yourself.

JASON

TOS 0.9: 200K
Video RAM (640x400 Pixel): 32K
RAM dynamically allocated by OS (GEM, Desktop etc): ~10K
Atari Basic: 190K
---
432 KBytes.

One overused phrase and a reference to peter smoking pot. Well, that's his
contribution for the day. Thanks, pete, we know you can't be creative. Maybe
if you STOPPED smelling the weed you'd realize a few things.

>It ain't so.. Have a bad day? Well, I suppose I have done a favor for Atari.

What favor? By showing that detractors of the Jag are whiny, brainless fools?

>I might aquire a Jagflop to add to my collections of classics. But will wait
>for the fire sale. I could conceivably be at Atari's Warehouse when the
>bankrupsy auction is taking place.

Yeah, if you live that long... It's gonna be a long time before ATari goes under. I bet Apple goes first.

>The rough water lies ahead for Atari, when the competition heats up to the
>boiling level.

Ooh, a poor analogy. Here's a hint: ROugh water is in the ocean. Oceans don't boil. If the competition is boiling, then Atari must be "cool" :)

>Atari's window of opportunity has evaporated. Get over it..

A window has evaporated? Must be another water reference... ANoyther clue: Windows are made of glass.

>This is typical Atari worshipper nonsence. You sound like your chocking up
>because I have stated the truth with factual information about your precious
>Jagflop. If no one listens to me, why are you responding?

You started with precious information about his your penis? I don't think he has your penis, petey... But then again, it doesn't seem like you do either. Oh, where's your facts? You haven't posted a single fact except your name in a long time...

>Get a hold of yourself. It's only a console. Life continues, get a grip.

And here he echoes what everyone else is telling him.

>Now attack the messenger personaly because the truth is told.

No, they attack you because you say nothing truthful at all.

>It ain't so. A Jagflop is bad und is did an it dead.. I sh

Incoherency is worth much in these parts, let me tell you. Still, this line is the most intelligent thing petey says in this post.

>Just get over it.. Your ravings will not save the Jagflop.

And get over it again. Sigh... FInal analysis of Petey's intelligence level: What intelligence level?
